(54) Title: INDAZOLE COMPOUNDS AND PHARMACEUTICAL COMPOSITIONS FOR INHIBITING PROTEIN KINASES, AND METHODS FOR THEIR USE

(57) Abstract: Indazole compounds that modulate and/or inhibit the activity of certain protein kinases are described. These compounds and pharmaceutical compositions containing them are capable of mediating tyrosine kinase signal transduction and thereby modulate and/or inhibit unwanted cell proliferation. The invention is also directed to the therapeutic or prophylactic use of pharmaceutical compositions containing such compounds, and to methods of treating cancer and other disease states associated with unwanted angiogenesis and/or cellular proliferation, such as diabetic retinopathy, neovascular glaucoma, rheumatoid arthritis, and psoriasis, by administering effective amounts of such compounds.

INDAZOLE COMPOUNDS AND PHARMACEUTICAL COMPOSITIONS FOR INHIBITING PROTEIN KINASES, AND METHODS FOR THEIR USE

CROSS-REFERENCE TO RELATED APPLICATION

5 This application claims the benefit of U.S. Provisional Patent Application No. 60/142,130, filed July 2, 1999.

FIELD OF THE INVENTION

This invention is directed to indazole compounds that mediate and/or inhibit the activity of certain protein kinases, and to pharmaceutical compositions

10 containing such compounds. The invention is also directed to the therapeutic or prophylactic use of such compounds and compositions, and to methods of treating cancer as well as other disease states associated with unwanted angiogenesis and/or cellular proliferation, by administering effective amounts of such compounds.

15 ## BACKGROUND OF THE INVENTION

Protein kinases are a family of enzymes that catalyze phosphorylation of the hydroxyl group of specific tyrosine, serine, or threonine residues in proteins. Typically, such phosphorylation dramatically perturbs the function of the protein, and thus protein kinases are pivotal in the regulation of a wide variety of cellular

20 processes, including metabolisim, cell proliferation, cell differentiation, and cell survival. Of the many different cellular functions in which the activity of protein kinases is known to be required, some processes represent attractive targets for therapeutic intervention for certain disease states. Two examples are angiogenesis and cell-cycle control, in which protein kinases play a pivotal role;

these processes are essential for the growth of solid tumors as well as for other diseases.

Angiogenesis is the mechanism by which new capillaries are formed from existing vessels. When required, the vascular system has the potential to generate

5 new capillary networks in order to maintain the proper functioning of tissues and organs. In the adult, however, angiogenesis is fairly limited, occurring only in the process of wound healing and neovascularization of the endometrium during menstruation. See Merenmies et al., *Cell Growth & Differentiation*, 8, 3-10 (1997). On the other hand, unwanted angiogenesis is a hallmark of several

10 diseases, such as retinopathies, psoriasis, rheumatoid arthritis, age-related macular degeneration (AMD), and cancer (solid tumors). Folkman, *Nature Med.*, 1, 27-31 (1995). Protein kinases which have been shown to be involved in the angiogenic process include three members of the growth factor receptor tyrosine kinase family: VEGF-R2 (vascular endothelial growth factor receptor 2, also known as

15 KDR (kinase insert domain receptor) and as FLK-1); FGF-R (fibroblast growth factor receptor); and TEK (also known as Tie-2).

VEGF-R2, which is expressed only on endothelial cells, binds the potent angiogenic growth factor VEGF and mediates the subsequent signal transduction through activation of its intracellular kinase activity. Thus, it is expected that

20 direct inhibition of the kinase activity of VEGF-R2 will result in the reduction of angiogenesis even in the presence of exogenous VEGF (see Strawn et al., *Cancer Research*, 56, 3540-3545 (1996)), as has been shown with mutants of VEGF-R2 which fail to mediate signal transduction. Millauer et al., *Cancer Research*, 56,

1615-1620 (1996). Furthermore, VEGF-R2 appears to have no function in the

adult beyond that of mediating the angiogenic activity of VEGF. Therefore, a

selective inhibitor of the kinase activity of VEGF-R2 would be expected to

exhibit little toxicity.

5   Similarly, FGF-R binds the angiogenic growth factors aFGF and bFGF

and mediates subsequent intracellular signal transduction. Recently, it has been

suggested that growth factors such as bFGF may play a critical role in inducing

angiogenesis in solid tumors that have reached a certain size. Yoshiji et al.,

Cancer Research, 57, 3924-3928 (1997). Unlike VEGF-R2, however, FGF-R is

10   expressed in a number of different cell types throughout the body and may or may

not play important roles in other normal physiological processes in the adult.

Nonetheless, systemic administration of a small-molecule inhibitor of the kinase

activity of FGF-R has been reported to block bFGF-induced angiogenesis in mice

without apparent toxicity. Mohammad et al., *EMBO Journal*, 17, 5996-5904

15   (1998).

TEK (also known as Tie-2) is another receptor tyrosine kinase expressed

only on endothelial cells which has been shown to play a role in angiogenesis.

The binding of the factor angiopoietin-1 results in autophosphorylation of the

kinase domain of TEK and results in a signal transduction process which appears

20   to mediate the interaction of endothelial cells with peri-endothelial support cells,

thereby facilitating the maturation of newly formed blood vessels. The factor

angiopoietin-2, on the other hand, appears to antagonize the action of

angiopoietin-1 on TEK and disrupts angiogenesis. Maisonpierre et al., *Science*,

277, 55-60 (1997).

As a result of the above-described developments, it has been proposed to treat angiogenesis by the use of compounds inhibiting the kinase activity of VEGF-R2, FGF-R, and/or TEK. For example, WIPO International Publication No. WO 97/34876 discloses certain cinnoline derivatives that are inhibitors of

5   VEGF-R2, which may be used for the treatment of disease states associated with abnormal angiogenesis and/or increased vascular permeability such as cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restinosis, autoimmune diseases, acute inflammation, and ocular diseases with retinal vessel proliferation.

10   Phosphorylase kinase activates glycogen phosphorylase, thus increasing glycogen breakdown and hepatic glucose release. Hepatic glucose production is disregulated in type 2 diabetes, and is the primary cause of fasting hyperglycemia, which results in many of the secondary complications afflicting these patients. Thus, reduction in glucose release from the liver would lower elevated plasma

15   glucose levels. Inhibitors of phosphorylase kinase should therefore decrease phosphorylase activity and glycogenolysis, thus reducing hyperglycemia in patients.

Another physiological response to VEGF is vascular hyperpermeability, which has been proposed to play a role in the early stages of angiogenesis. In

20   ischemic tissues, such as those occurring in the brain of stroke victims, hypoxia trigger VEGF expression, leading to increased vascular permeability and ultimately edema in the surrounding tissues. In a rat model for stroke, it has been shown by van Bruggen et al., *J. Clinical Invest.*, 104, 1613-20 (1999) that

administration of a monoclonal antibody to VEGF reduces the infarct volume.

Thus, inhibitors of VEGFR are anticipated to be useful for the treatment of stroke.

In addition to its role in angiogenesis, protein kinases also play a crucial

role in cell-cycle control. Uncontrolled cell proliferation is the insignia of cancer.

5   Cell proliferation in response to various stimuli is manifested by a de-regulation

of the cell division cycle, the process by which cells multiply and divide. Tumor

cells typically have damage to the genes that directly or indirectly regulate

progression through the cell division cycle.

Cyclin-dependent kinases (CDKs) are serine-threonine protein kinases that

10   play critical roles in regulating the transitions between different phases of the cell

cycle. See, e.g., the articles compiled in *Science*, 274, 1643-1677 (1996). CDK

complexes are formed through association of a regulatory cyclin subunit (e.g.,

cyclin A, B1, B2, D1, D2, D3, and E) and a catalytic kinase subunit (e.g., cdc2

(CDK1), CDK2, CDK4, CDK5, and CDK6). As the name implies, the CDKs

15   display an absolute dependence on the cyclin subunit in order to phosphorylate

their target substrates, and different kinase/cyclin pairs function to regulate

progression through specific phases of the cell cycle.

It is CDK4 complexed to the D cyclins that plays a critical part in

initiating the cell-division cycle from a resting or quiescent stage to one in which

20   cells become committed to cell division. This progression is subject to a variety

of growth regulatory mechanisms, both negative and positive. Aberrations in this

control system, particularly those that affect the function of CDK4, have been

implicated in the advancement of cells to the highly proliferative state

characteristic of malignancies, particularly familial melanomas, esophageal

carcinomas, and pancreatic cancers. See, e.g., Kamb, *Trends in Genetics*, 11, 136-140 (1995); Kamb et al., *Science*, 264, 436-440 (1994).

Myriad publications describe a variety of chemical compounds useful against a variety of therapeutic targets. For example, WIPO International

5   Publication Nos. WO 99/23077 and WO 99/23076 describe indazole-containing compounds having phosphodiesterase type IV inhibitory activity produced by an indazole-for-catechol bioisostere replacement. U.S. Patent No. 5,760,028 discloses heterocycles including 3-[1-[3-(imidazolin-2-ylamino)propyl]indazol-5-ylcarbonylamino]-2-(benzyloxycarbonylamino)propionic acid, which are useful

10   as antagonists of the $\alpha_v\beta_3$ integrin and related cell surface adhesive protein receptors. WIPO International Publication No. WO 98/09961 discloses certain indazole derivatives and their use as inhibitors of phosphodiesterase (PDE) type IV or the production of tumor necrosis factor (TNF) in a mammal. Recent additions to the virtual library of known compounds include those described as

15   being anti-proliferative therapeutic agents that inhibit CDKs. For example, U.S. Patent No. 5,621,082 to Xiong et al. discloses nucleic acid encoding an inhibitor of CDK6, and European Patent Publication No. 0 666 270 A2 describes peptides and peptide mimetics that act as inhibitors of CDK1 and CDK2. WIPO International Publication No. WO 97/16447 discloses certain analogs of

20   chromones that are inhibitors of cyclin-dependent kinases, in particular of CDK/cyclin complexes such as CDK4/cyclin D1, which may be used for inhibiting excessive or abnormal cell proliferation, and therefore for treating

cancer. WIPO International Publication No. WO 99/21845 describes 4-aminothiazole derivatives that are useful as CDK inhibitors.

There is still a need, however, for small-molecule compounds that may be readily synthesized and are effective in inhibiting one or more CDKs or

5   CDK/cyclin complexes. Because CDK4 may serve as a general activator of cell division in most cells, and complexes of CDK4 and D-type cyclins govern the early G_1 phase of the cell cycle, there is a need for effective inhibitors of CDK4, and D-type cyclin complexes thereof, for treating one or more types of tumors. Also, the pivotal roles of cyclin E/CDK2 and cyclin B/CDK1 kinases in the G_1/S

10   phase and G_2/M transitions, respectively, offer additional targets for therapeutic intervention in suppressing deregulated cell-cycle progression in cancer.

Another protein kinase, CHK1, plays an important role as a checkpoint in cell-cycle progression. Checkpoints are control systems that coordinate cell-cycle progression by influencing the formation, activation and subsequent inactivation

15   of the cyclin-dependent kinases. Checkpoints prevent cell-cycle progression at inappropriate times, maintain the metabolic balance of cells while the cell is arrested, and in some instances can induce apoptosis (programmed cell death) when the requirements of the checkpoint have not been met. See, e.g., O'Connor, *Cancer Surveys*, 29, 151-182 (1997); Nurse, *Cell*, 91, 865-867 (1997); Hartwell et

20   al., *Science*, 266, 1821-1828 (1994); Hartwell et al., *Science*, 246, 629-634 (1989).

One series of checkpoints monitors the integrity of the genome and, upon sensing DNA damage, these "DNA damage checkpoints" block cell-cycle

progression in G_1 and G_2 phases, and slow progression through S phase.

O'Connor, *Cancer Surveys*, 29, 151-182 (1997); Hartwell et al., *Science*, 266,

1821-1828 (1994). This action enables DNA repair processes to complete their

tasks before replication of the genome and subsequent separation of this genetic

5   material into new daughter cells takes place. Importantly, the most commonly

mutated gene in human cancer, the p53 tumor suppressor gene, produces a DNA

damage checkpoint protein that blocks cell-cycle progression in G_1 phase and/or

induces apoptosis (programmed cell death) following DNA damage. Hartwell et

al., *Science*, 266, 1821-1828 (1994). The p53 tumor suppressor has also been

10   shown to strengthen the action of a DNA damage checkpoint in G_2 phase of the

cell cycle. See, e.g., Bunz et al., *Science,* 28, 1497-1501 (1998); Winters et al.,

Oncogene, 17, 673-684 (1998); Thompson, *Oncogene,* 15, 3025-3035 (1997).

Given the pivotal nature of the p53 tumor suppressor pathway in human

cancer, therapeutic interventions that exploit vulnerabilities in p53-defective

15   cancer have been actively sought. One emerging vulnerability lies in the

operation of the G_2 checkpoint in p53 defective cancer cells. Cancer cells,

because they lack G_1 checkpoint control, are particularly vulnerable to abrogation

of the last remaining barrier protecting them from the cancer-killing effects of

DNA-damaging agents: the G_2 checkpoint. The G_2 checkpoint is regulated by a

20   control system that has been conserved from yeast to humans. Important in this

conserved system is a kinase, CHK1, which transduces signals from the DNA-

damage sensory complex to inhibit activation of the cyclin B/Cdc2 kinase, which

promotes mitotic entry. See, e.g., Peng et al., *Science,* 277, 1501-1505 (1997);

8

Sanchez et al., *Science,* 277, 1497-1501 (1997). Inactivation of CHK1 has been

shown to both abrogate G_2 arrest induced by DNA damage inflicted by either

anticancer agents or endogenous DNA damage, as well as result in preferential

killing of the resulting checkpoint defective cells. See, e.g., Nurse, *Cell,* 91, 865-

5   867 (1997); Weinert, *Science,* 277, 1450-1451 (1997); Walworth et al., *Nature,*

363, 368-371 (1993); and Al-Khodairy et al., *Molec. Biol. Cell,* 5, 147-160

(1994).

Selective manipulation of checkpoint control in cancer cells could afford

broad utilization in cancer chemotherapeutic and radiotherapy regimens and may,

10   in addition, offer a common hallmark of human cancer "genomic instability" to

be exploited as the selective basis for the destruction of cancer cells. A number of

factors place CHK1 as a pivotal target in DNA-damage checkpoint control. The

elucidation of inhibitors of this and functionally related kinases such as

Cds1/CHK2, a kinase recently discovered to cooperate with CHK1 in regulating S

15   phase progression (see Zeng et al., *Nature,* 395, 507-510 (1998); Matsuoka,

Science, 282, 1893-1897 (1998)), could provide valuable new therapeutic entities

for the treatment of cancer.

Integrin receptor binding to ECM initiates intracellular signals mediated by

FAK (Focal Adhesion Kinase) that are involved in cell motility, cellular

20   proliferation, and survival. In human cancers, FAK overexpression is implicated

in tumorigenesis and metastatic potential through its role in integrin mediated

signaling pathways.

Tyrosine kinases can be of the receptor type (having extracellular, transmembrane and intracellular domains) or the non-receptor type (being wholly intracellular). At least one of the non-receptor protein tyrosine kinases, namely, LCK, is believed to mediate the transduction in T-cells of a signal from the

5 interaction of a cell-surface protein (Cd4) with a cross-linked anti-Cd4 antibody. A more detailed discussion of non-receptor tyrosine kinases is provided in Bolen, *Oncogene*, 8, 2025-2031 (1993), which is incorporated herein by reference.

In addition to the protein kinases identified above, many other protein kinases have been considered to be therapeutic targets, and numerous

10 publications disclose inhibitors of kinase activity, as reviewed in the following: McMahon et al, *Oncologist*, 5, 3-10 (2000); Holash et al., *Oncogene*, 18, 5356-62 (1999); Thomas et al., *J. Biol. Chem.*, 274, 36684-92 (1999); Cohen, *Curr. Op. Chem. Biol.*, 3, 459-65 (1999); Klohs et al., *Curr. Op. Chem. Biol.*, 10, 544-49 (1999); McMahon et al., *Current Opinion in Drug Discovery & Development*, 1,

15 131-146 (1998); Strawn et al., *Exp. Opin. Invest. Drugs*, 7, 553-573 (1998). WIPO International Publication WO 00/18761 discloses certain substituted 3-cyanoquinolines as protein kinase inhibitors.

There is still a need, however, for effective inhibitors of protein kinases. Moreover, as is understood by those skilled in the art, it is desirable for kinase

20 inhibitors to possess both high affinity for the target kinase or kinases as well as high selectivity versus other protein kinases.

SUMMARY OF THE INVENTION

Thus, an objective of the invention is to discover potent inhibitors of

protein kinases. Another objective of the invention is to discover effective kinase

inhibitors having a strong and selective affinity for one or more particular kinases.

5   These and other objectives of the invention, which will become apparent

from the following description, have been achieved by the discovery of the

indazole compounds, pharmaceutically acceptable prodrugs, pharmaceutically

active metabolites, and pharmaceutically acceptable salts thereof (such

compounds, prodrugs, metabolites and salts are collectively referred to as

10   "agents") described below, which modulate and/or inhibit the activity of protein

kinases. Pharmaceutical compositions containing such agents are useful in

treating diseases mediated by kinase activity, such as cancer, as well as other

disease states associated with unwanted angiogenesis and/or cellular proliferation,

such as diabetic retinopathy, neovascular glaucoma, rheumatoid arthritis, and

15   psoriasis. Further, the agents have advantageous properties relating to the

modulation and/or inhibition of the kinase activity associated with VEGF-R,

FGF-R, CDK complexes, CHK1, LCK, TEK, FAK, and/or phosphorylase kinase.

In a general aspect, the invention relates to compounds of the Formula I:
20   wherein:

R¹ is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R³ or CH=N—R³ where R³ is a substituted or unsubstituted

alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl; and

R² is a substituted or unsubstituted aryl, heteroaryl, or Y-X, where Y is O,

5   S, C=CH₂, C=O, S=O, SO₂, alkylidene, NH, or N-(C₁-C₈ alkyl), and X is

substituted or unsubstituted Ar, heteroaryl, NH-(alkyl), NH-(cycloalkyl), NH-

(heterocycloalkyl), NH(aryl), NH(heteroaryl), NH-(alkoxyl), or NH-

(dialkylamide), where Ar is aryl;

The invention is also directed to pharmaceutically acceptable prodrugs,

10   pharmaceutically active metabolites, and pharmaceutically acceptable salts of the

compounds of Formula I. Advantageous methods of making the compounds of

the Formula I are also described.

In another general aspect, the invention relates to compounds of the
Formula I(a):

I(a)

15

wherein:

R¹ is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R³ or CH=N—R³ where R³ is a substituted or unsubstituted

alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl; and

R^2 is a substituted or unsubstituted aryl or Y-Ar, where Y is O, S, C=CH$_2$, C=O, S=O, SO$_2$, CH$_2$, CHCH$_3$, NH, or N-(C$_1$-C$_8$ alkyl), and Ar is a substituted or unsubstituted aryl.

The invention is also directed to pharmaceutically acceptable prodrugs,

5   pharmaceutically active metabolites, and pharmaceutically acceptable salts of the compounds of Formula I(a). Advantageous methods of making the compounds of the Formula I(a) are also described.

In one preferred general embodiment, the invention relates to compounds having the Formula II:
II

10

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

15   R^4 and R^7 are each independently hydrogen, OH, halo, C$_1$-C$_8$ alkyl, C$_1$-C$_8$ alkoxy, C$_1$-C$_8$ alkenyl, aryloxy, thioaryl, CH$_2$-OH, CH$_2$-O- (C$_1$-C$_8$ alkyl), CH$_2$-O-aryl, CH$_2$-S-(C$_1$-C$_8$ alkyl), or CH$_2$-S-aryl;

R^5 and R^6 are each independently hydrogen, OH, halo, Z-alkyl, Z-aryl, or

Z-CH$_2$CH=CH$_2$, where Z is O, S, NH, or CH$_2$, and the alkyl and aryl moieties of

Z-alkyl and Z-aryl are each optionally substituted;

and pharmaceutically acceptable prodrugs, pharmaceutically active

5   metabolites, and pharmaceutically acceptable salts thereof.

In a preferred embodiment of Formula II: R^1 is a substituted or

unsubstituted bicyclic heteroaryl, or a group of the formula CH=CH—R^3 where

R^3 is a substituted or unsubstituted aryl or heteroaryl; R^4 and R^7 are each

independently hydrogen or C$_1$-C$_8$ alkyl; and R^5 and R^6 are each independently

10   halo, Z-alkyl, or Z-CH$_2$CH=CH$_2$, where Z is O or S.

In another preferred general embodiment, compounds of the invention are

of Formula III:

III
wherein:

15   R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

Y is O, S, C=CH$_2$, C=O, S=O, SO$_2$, CH$_2$, CHCH$_3$, NH, or N-(C$_1$-C$_8$ alkyl);

R^8 is a substituted or unsubstituted alkyl, alkenyl, cycloalkyl,

20   heterocycloalkyl, aryl, heteroaryl, alkoxyl, or aryloxyl;

R^{10} is independently selected from hydrogen, halogen, and lower-alkyl;

and pharmaceutically acceptable prodrugs, pharmaceutically acceptable

metabolites, and pharmaceutically acceptable salts thereof.

More preferably, in Formula III: R^1 is a substituted or unsubstituted

5   bicyclic heteroaryl, or a group of the formula CH=CH—R^3 where R^3 is a

substituted or unsubstituted aryl or heteroaryl; Y is O, S, C=CH_2, C=O, NH, or N-

(C_1-C_8 alkyl); R^8 is a substituted or unsubstituted aryl, heteroaryl, alkyl, and

alkenyl, and R^{10} is hydrogen or halogen.

In another preferred general embodiment, compounds of the invention are

10   of Formula III(a):

III(a)

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

15   alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

Y is O, S, C=CH_2, C=O, S=O, SO_2, CH_2, $CHCH_3$, NH, or N-(C_1-C_8 alkyl);

R^8 is a substituted or unsubstituted alkyl, alkenyl, cycloalkyl,

heterocycloalkyl, aryl, heteroaryl, alkoxyl, or aryloxyl;

and pharmaceutically acceptable prodrugs, pharmaceutically acceptable

20   metabolites, and pharmaceutically acceptable salts thereof.

More preferably, in Formula III(a): R^1 is a substituted or unsubstituted

bicyclic heteroaryl, or a group of the formula CH=CH—R^3 where R^3 is a

substituted or unsubstituted aryl or heteroaryl; Y is O, S, C=CH_2, C=O, NH, or N-

(C_1-C_8 alkyl); and R^8 is a substituted or unsubstituted aryl or heteroaryl.

5   In another preferred general embodiment, compounds of the invention are

of Formula IV:

IV

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

10   formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

Y is O, S, C=CH_2, C=O, S=O, SO_2, CH_2, $CHCH_3$, NH, or N-(C_1-C_8 alkyl);

R^9 is a substituted or unsubstituted alkyl, cycloalkyl, heterocycloalkyl,

aryl, heteroaryl, alkoxyl, aryloxyl, cycloalkoxyl, NH-(C_1-C_8 alkyl), NH-(aryl),

15   NH-(heteroaryl), N=CH–(alkyl), NH(C=O)R^{11}, or NH_2, where R^{11} is independently

selected from hydrogen, substituted or unsubstituted alkyl, cycloalkyl,

heterocycloalkyl, aryl, and heteroaryl; and

R^{10} is independently selected from hydrogen, halogen, and lower-alkyl;

and pharmaceutically acceptable prodrugs, pharmaceutically acceptable

20   metabolites, and pharmaceutically acceptable salts thereof.

More preferably, in Formula IV: R^1 is a group of the formula CH=CH—

R^3 where R^3 is a substituted or unsubstituted aryl or heteroaryl; Y is S or NH, and

R^9 is a substituted or unsubstituted alkyl, alkoxyl, or NH-(heteroaryl).

Most preferred are compounds of the invention selected from:

5

10

, , , , , , , and .

20
The invention also relates to a method of modulating and/or inhibiting the

kinase activity of VEGF-R, FGF-R, a CDK complex, CHK1, LCK, TEK, FAK,

and/or phosphorylase kinase by administering a compound of the Formula I, II,

III, or IV, or a pharmaceutically acceptable prodrug, pharmaceutically active

5   metabolite, or pharmaceutically acceptable salt thereof. Preferred compounds of

the present invention that have selective kinase activity—i.e., they possess

significant activity against one or more specific kinases while possessing less or

minimal activity against one or more different kinases. In one preferred

embodiment of the invention, compounds of the present invention are those of

10   Formula I possessing substantially higher potency against VEGF receptor tyrosine

kinase than against FGF-R1 receptor tyrosine kinase. The invention is also

directed to methods of modulating VEGF receptor tyrosine kinase activity

without significantly modulating FGF receptor tyrosine kinase activity.

The inventive compounds may be used advantageously in combination

15   with other known therapeutic agents. For example, compounds of Formula I, II,

III, or IV which possess antiangiogenic activity may be co-administered with

cytotoxic chemotherapeutic agents, such as taxol, taxotere, vinblastine, cis-platin,

doxorubicin, adriamycin, and the like, to produce an enhanced antitumor effect.

Additive or synergistic enhancement of therapeutic effect may also be obtained

20   by co-administration of compounds of Formula I, II, III, or IV which possess

antiangiogenic activity with other antiangiogenic agents, such as combretastatin

A-4, endostatin, prinomastat, celecoxib, rofocoxib, EMD121974, IM862, anti-

VEGF monoclonal antibodies, and anti-KDR monoclonal antibodies.

The invention also relates pharmaceutical compositions, each comprising

an effective amount of an agent selected from compounds of Formula I and pharmaceutically acceptable salts, pharmaceutically active metabolites, and pharmaceutically acceptable prodrugs thereof; and a pharmaceutically acceptable carrier or vehicle for such agent. The invention further provides methods of

5   treating cancer as well as other disease states associated with unwanted angiogenesis and/or cellular proliferation, comprising administering effective amounts of such an agent to a patient in need of such treatment.

DETAILED DESCRIPTION OF INVENTION AND PREFERRED EMBODIMENTS

The inventive compounds of the Formula I, II, III, and IV are useful for

10   mediating the activity of protein kinases. More particularly, the compounds are useful as anti-angiogenesis agents and as agents for modulating and/or inhibiting the activity of protein kinases, thus providing treatments for cancer or other diseases associated with cellular proliferation mediated by protein kinases.

The term "alkyl" as used herein refers to straight- and branched-chain alkyl

15   groups having one to twelve carbon atoms. Exemplary alkyl groups include methyl (Me), ethyl (Et), n-propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl (t-Bu), pentyl, isopentyl, tert-pentyl, hexyl, isohexyl, and the like. The term "lower alkyl" designates an alkyl having from 1 to 8 carbon atoms (a C_{1-8}-alkyl). Suitable substituted alkyls include fluoromethyl, difluoromethyl, trifluoromethyl, 2-

20   fluoroethyl, 3-fluoropropyl, hydroxymethyl, 2-hydroxyethyl, 3-hydroxypropyl, and the like.

The term "alkylidene" refers to a divalent radical having one to twelve carbon atoms. Illustrative alkylidene groups include CH_2, $CHCH_3$, $(CH_3)_2$, and the like.

22

The term "alkenyl" refers to straight- and branched-chain alkenyl groups having from two to twelve carbon atoms. Illustrative alkenyl groups include prop-2-enyl, but-2-enyl, but-3-enyl, 2-methylprop-2-enyl, hex-2-enyl, and the like.

The term "alkynyl" refers to straight- and branched-chain alkynyl groups

5   having from two to twelve carbon atoms.

The term "cycloalkyl" refers to saturated or partially unsaturated carbocycles having from three to twelve carbon atoms, including bicyclic and tricyclic cycloalkyl structures. Suitable cycloalkyls include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and the like.

10   A "heterocycloalkyl" group is intended to mean a saturated or partially unsaturated monocyclic radical containing carbon atoms, preferably 4 or 5 ring carbon atoms, and at least one heteroatom selected from nitrogen, oxygen and sulfur.

The terms "aryl" and "heteroaryl" refer to monocyclic and polycyclic unsaturated or aromatic ring structures, with "aryl" referring to those that are

15   carbocycles and "heteroaryl" referring to those that are heterocycles. Examples of aromatic ring structures include phenyl, naphthyl, 1,2,3,4-tetrahydronaphthyl, furyl, thienyl, pyrrolyl, pyridinyl, pyrazolyl, imidazolyl, pyrazinyl, pyridazinyl, 1,2,3-triazinyl, 1,2,4-oxadiazolyl, 1,3,4-oxadiazolyl, 1-H-tetrazol-5-yl, indolyl, quinolinyl, benzofuranyl, benzothiophenyl (thianaphthenyl), and the like. Such moieties may be

20   optionally substituted by a fused-ring structure or bridge, for example OCH$_2$-O.

The term "alkoxy" is intended to mean the radical –O-alkyl. Illustrative examples include methoxy, ethoxy, propoxy, and the like.

The term "aryloxy" respresents –O—aryl, wherein aryl is defined above.

The term "cycloalkoxyl" represents –O—cycloalkyl, wherein cycloalkyl is defined above.

The term "halogen" represents chlorine, fluorine, bromine or iodine. The term "halo" represents chloro, fluoro, bromo or iodo.

5   In general, the various moieties or functional groups for variables in the formulae may be optionally substituted by one or more suitable substituents. Exemplary substituents include a halogen (F, Cl, Br, or I), lower alkyl, -OH, -NO$_2$, -CN, -CO$_2$H, -O-lower alkyl, -aryl, -aryl-lower alkyl, -CO$_2$CH$_3$, -CONH$_2$, -OCH$_2$CONH$_2$, -NH$_2$, -SO$_2$NH$_2$, haloalkyl (e.g., -CF$_3$, -CH$_2$CF$_3$), -O-haloalkyl (e.g., -

10   OCF$_3$, -OCHF$_2$), and the like.

The terms "comprising" and "including" are used in an open, non-limiting sense.

It is understood that while a compound of Formula I may exhibit the phenomenon of tautomerism, the formula drawings within this specification

15   expressly depict only one of the possible tautomeric forms. It is therefore to be understood that within the invention the formulae are intended to represent any tautomeric form of the depicted compound and is not to be limited merely to a specific tautomeric form depicted by the formula drawings.

Some of the inventive compounds may exist as single stereoisomers (i.e.,

20   essentially free of other stereoisomers), racemates, and/or mixtures of enantiomers and/or diastereomers. All such single stereoisomers, racemates and mixtures thereof are intended to be within the scope of the present invention. Preferably, the inventive compounds that are optically active are used in optically pure form.

As generally understood by those skilled in the art, an optically pure compound

having one chiral center is one that consists essentially of one of the two possible

enantiomers (i.e., is enantiomerically pure), and an optically pure compound having

more than one chiral center is one that is both diastereomerically pure and

5   enantiomerically pure. Preferably, the compounds of the present invention are used in

a form that is at least 90% optically pure, that is , a form that contains at least 90% of

a single isomer (80% enantiomeric excess ("e.e.") or diastereomeric excess ("d.e.")),

more preferably at least 95% (90% e.e. or d.e.), even more preferably at least 97.5%

(95% e.e. or d.e.), and most preferably at least 99% (98% e.e. or d.e.).

10   Additionally, the formulas are intended to cover solvated as well as

unsolvated forms of the identified structures. For example, Formula I includes

compounds of the indicated structure in both hydrated and non-hydrated forms.

Other examples of solvates include the structures in combination with isopropanol,

ethanol, methanol, DMSO, ethyl acetate, acetic acid, or ethanolamine.

15   In addition to compounds of the Formula I, II, III, and IV, the invention

includes pharmaceutically acceptable prodrugs, pharmaceutically active metabolites,

and pharmaceutically acceptable salts of such compounds.

"A pharmaceutically acceptable prodrug" is a compound that may be

converted under physiological conditions or by solvolysis to the specified compound

20   or to a pharmaceutically acceptable salt of such compound.

"A pharmaceutically active metabolite" is intended to mean a

pharmacologically active product produced through metabolism in the body of a

specified compound or salt thereof. Metabolites of a compound may be identified

using routine techniques known in the art and their activities determined using tests

such as those described herein.

Prodrugs and active metabolites of a compound may be identified using

routine techniques known in the art. See, e.g., Bertolini, G. et al., *J. Med. Chem.*, 40,

5   2011-2016 (1997); Shan, D. et al., *J. Pharm. Sci.*, 86 (7), 765-767; Bagshawe K.,

Drug Dev. Res., 34, 220-230 (1995); Bodor, N., *Advances in Drug Res.*, 13, 224-331

(1984); Bundgaard, H., *Design of Prodrugs* (Elsevier Press 1985); and Larsen, I. K.,

Design and Application of Prodrugs, Drug Design and Development (Krogsgaard-

Larsen et al., eds., Harwood Academic Publishers, 1991).

10   "A pharmaceutically acceptable salt" is intended to mean a salt that retains the

biological effectiveness of the free acids and bases of the specified compound and that

is not biologically or otherwise undesirable. A compound of the invention may

possess a sufficiently acidic, a sufficiently basic, or both functional groups, and

accordingly react with any of a number of inorganic or organic bases, and inorganic

15   and organic acids, to form a pharmaceutically acceptable salt. Exemplary

pharmaceutically acceptable salts include those salts prepared by reaction of the

compounds of the present invention with a mineral or organic acid or an inorganic

base, such as salts including sulfates, pyrosulfates, bisulfates, sulfites, bisulfites,

phosphates, monohydrogenphosphates, dihydrogenphosphates, metaphosphates,

20   pyrophosphates, chlorides, bromides, iodides, acetates, propionates, decanoates,

caprylates, acrylates, formates, isobutyrates, caproates, heptanoates, propiolates,

oxalates, malonates, succinates, suberates, sebacates, fumarates, maleates, butyne-1,4-

dioates, hexyne-1,6-dioates, benzoates, chlorobenzoates, methylbenzoates,

dinitrobenzoates, hydroxybenzoates, methoxybenzoates, phthalates, sulfonates,

xylenesulfonates, phenylacetates, phenylpropionates, phenylbutyrates, citrates,

lactates, γ-hydroxybutyrates, glycollates, tartrates, methane-sulfonates,

propanesulfonates, naphthalene-1-sulfonates, naphthalene-2-sulfonates, and

5   mandelates.

If the inventive compound is a base, the desired pharmaceutically

acceptable salt may be prepared by any suitable method available in the art, for

example, treatment of the free base with an inorganic acid, such as hydrochloric

acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid and the like, or

10   with an organic acid , such as acetic acid, maleic acid, succinic acid, mandelic

acid, fumaric acid, malonic acid, pyruvic acid, oxalic acid, glycolic acid, salicylic

acid, a pyranosidyl acid, such as glucuronic acid or galacturonic acid, an alpha-

hydroxy acid, such as citric acid or tartaric acid, an amino acid, such as aspartic

acid or glutamic acid, an aromatic acid, such as benzoic acid or cinnamic acid, a

15   sulfonic acid, such as p-toluenesulfonic acid or ethanesulfonic acid, or the like.

If the inventive compound is an acid, the desired pharmaceutically

acceptable salt may be prepared by any suitable method, for example, treatment of

the free acid with an inorganic or organic base, such as an amine (primary,

secondary or tertiary), an alkali metal hydroxide or alkaline earth metal hydroxide,

20   or the like. Illustrative examples of suitable salts include organic salts derived

from amino acids, such as glycine and arginine, ammonia, primary, secondary,

and tertiary amines, and cyclic amines, such as piperidine, morpholine and

piperazine, and inorganic salts derived from sodium, calcium, potassium,

magnesium, manganese, iron, copper, zinc, aluminum and lithium.

In the case of agents that are solids, it is understood by those skilled in the art

that the inventive compounds and salts may exist in different crystal or polymorphic

5   forms, all of which are intended to be within the scope of the present invention and

specified formulas.

Therapeutically effective amounts of the agents of the invention may be used

to treat diseases mediated by modulation or regulation of protein kinases. An

"effective amount" is intended to mean that amount of an agent that, when

10   administered to a mammal in need of such treatment, is sufficient to effect treatment

for a disease mediated by the activity of one or more protein kinases, such as tryosine

kinases. Thus, e.g., a therapeutically effective amount of a compound of the Formula

I, salt, active metabolite or prodrug thereof is a quantity sufficient to modulate,

regulate, or inhibit the activity of one or more protein kinases such that a disease

15   condition which is mediated by that activity is reduced or alleviated.

The amount of a given agent that will correspond to such an amount will vary

depending upon factors such as the particular compound, disease condition and its

severity, the identity (e.g., weight) of the mammal in need of treatment, but can

nevertheless be routinely determined by one skilled in the art. "Treating" is intended

20   to mean at least the mitigation of a disease condition in a mammal, such as a human,

that is affected, at least in part, by the activity of one or more protein kinases, such as

tyrosine kinases, and includes: preventing the disease condition from occurring in a

mammal, particularly when the mammal is found to be predisposed to having the

28

disease condition but has not yet been diagnosed as having it; modulating and/or

inhibiting the disease condition; and/or alleviating the disease condition.

The inventive agents may be prepared using the reaction routes and synthesis

schemes as described below, employing the techniques available in the art using

5   starting materials that are readily available.

In one general synthetic process, compounds of Formula I are prepared

according to the following reaction scheme:
6-Nitroindazole (compound **V**) is treated with iodine and base, e.g.,

NaOH, in an aqueous/organic mixture, preferably with dioxane. The mixture is

acidified and the product isolated by filtration. To the resulting 3-iodo-6-

nitroindazole in dichloromethane-50% aqueous KOH at 0 °C is added a

protecting group ("Pg") reagent (wherein X = halo), preferably

trimethylsilylethoxymethyl chloride (SEM-Cl), and a phase transfer catalyst, e.g.,

tetrabutylammonium bromide (TBABr). After 1-4 hours, the two phases are

5 diluted, the organics are separated, dried with sodium sulfate, filtered and

concentrated. The crude product is purified by silica gel chromatography to give

compounds of formula VI. Treatment of compounds of formula VI in a suitable

organic solvent with a suitable R^1-organometallic reagent, preferably an R^1-

boronic acid, in the presence of aqueous base, e.g., sodium carbonate, and a

10 suitable catalyst, preferably $Pd(PPh_3)_4$, gives, after extractive work-up and silica

gel chromatography, compounds of formula VII. The R^1 substituent may be

exchanged within compounds of formula VII or later intermediates throughout

this scheme by oxidative cleavage (e.g., ozonolysis) followed by additions to the

resulting aldehyde functionality with Wittig or condensation transformations

15 (typified in Example 42(a-e)). Treatment of compounds of formula VII with a

reducing agent, preferably $SnCl_2$, provides, after conventional aqueous work up

and purification, compounds of formula VIII. For the series of derivatives where

Y = NH or N-lower alkyl, compounds of formula VIII may be treated with aryl or

heteroaryl chlorides, bromides, iodides or triflates in the presence of a base,

20 preferably Cs_2CO_3, and catalyst, preferably Pd-BINAP, (and where Y = N-lower

alkyl, with a subsequent alkylation step) to provide compounds of formula X. To

produce other Y linkages, sodium nitrite is added to compounds of formula VIII

under chilled standard aqueous acidic conditions followed by the addition of

potassium iodide and gentle warming. Standard work-up and purification produces iodide compounds of formula IX.

Treatment of compounds of formula IX with an organometallic reagent, e.g., butyllithium, promotes lithium halogen exchange. This intermediate is then reacted

5 with an R^2 electrophile, e.g., a carbonyl or triflate, through the possible mediation of additional metals and catalysts, preferably zinc chloride and $Pd(PPh_3)_4$ to provide compounds of formula X. Alternatively, compounds of formula IX may be treated with an organometallic reagent such as an organoboronic acid in the presence of a catalyst, e.g., $Pd(PPh_3)_4$, under a carbon monoxide atmosphere to give compounds of

10 formula X. Alternatively, for derivatives where Y = NH or S, compounds of formula IX may be treated with appropriate amines or thiols in the presence of base, preferably Cs_2CO_3 or K_3PO_4 and a catalyst, preferably Pd-BINAP or Pd-(bis-cyclohexyl)biphenylphosphine to provide compounds of formula X. Conventional functional group interchanges, such as oxidations, reductions, alkylations, acylations,

15 condensations, and deprotections may then be employed to further derivatize this series giving final compounds of Formula I.

The inventive compounds of Formula I may also be prepared according general procedure shown in the following scheme:
6-Iodoindazole (**XI**) is treated with iodine and base, e.g., NaOH, in an

aqueous/organic mixture, preferably with dioxane. The mixture is acidified and the

product **XII** is isolated by filtration. To the resulting 3,6 di-iodoindazole in

dichloromethane-50% aqueous KOH at 0 °C is added a protecting group reagent,

preferably SEM-Cl, and a phase transfer catalyst, e.g., TBABr. The two phases are

diluted, the organics separated, dried with sodium sulfate, filtered and concentrated.

The crude product is purified by silica gel chromatography to give compounds of the

formula **XIII**. Treatment of compounds of formula **XIII** in a suitable organic solvent

with a suitable R^2-organometallic reagent, e.g., R^2-ZnCl or boron R^2-boron reagent

and a suitable catalyst, preferably Pd(PPh$_3$)$_4$ gives, after extractive work-up and silica

gel chromatography, compounds of formula **XIV**. Treatment of compounds of

formula **XIV** in a suitable organic solvent with a suitable R^1-organometallic reagent

5   (e.g., boron R^1-boron reagent or R^1-ZnCl), in the presence of aqueous base, sodium

carbonate, and a suitable catalyst, preferably Pd(PPh$_3$)$_4$ gives, after extractive work-up

and silica gel chromatography, compounds of formula **XV**. Conventional functional

group interchanges, such as oxidations, reductions, alkylations, acylations,

condensations and deprotections may then be employed to further derivatize this

10   series giving final compounds of Formula I.

Alternatively, compounds of Formula I where R^2 is a substituted or

unsubstituted Y-Ar, where Y is O or S may be prepared according to the

following general scheme:

15
A stirred acetone solution of 3-chloro-cyclohex-2-enone (**XV**), H-R^2, and

anhydrous potassium carbonate is refluxed for 15-24 hours, cooled, and filtered.

Concentrating and chromatographing the filtrate on silica gel gives 3-R^2-

5   cyclohex-2-enone (**XVI**).

The ketones of formula **XVI** may be reacted with a suitable base (M-B),

preferably lithium bis(trimethylsily)amide, and reacted with R^1-CO-X (where X =

halogen), which after standard acid work up and purification provides compounds

of the formula **XVII**. This product, in HOAc/EtOH, combined with hydrazine

10   monohydrate, is heated at a suitable temperature for an appropriate time period,

preferably at 60-80 °C for 2-4 hours. After cooling, the mixture is poured into

saturated sodium bicarbonate solution, extracted with an organic solvent,

concentrated, and purified on silica gel to give compounds of formula **XVIII**.

Compounds of formula **XVIII** may be oxidized using a variety of known methods

5   to give compounds of the Formula I.

Other compounds of Formula I may be prepared in manners analogous to

the general procedures described above or the detailed procedures described in

the examples herein. The affinity of the compounds of the invention for a receptor

may be enhanced by providing multiple copies of the ligand in close proximity,

10   preferably using a scaffolding provided by a carrier moiety. It has been shown that

provision of such multiple valence compounds with optimal spacing between the

moieties dramatically improves binding to a receptor. See, e.g., Lee et al.,

Biochem, 23, 4255 (1984). The multivalency and spacing can be controlled by

selection of a suitable carrier moiety or linker units. Such moieties include

15   molecular supports which contain a multiplicity of functional groups that can be

reacted with functional groups associated with the compounds of the invention.

Of course, a variety of carriers can be used, including proteins such as BSA or

HAS, a multiplicity of peptides including, for example, pentapeptides,

decapeptides, pentadecapeptides, and the like. The peptides or proteins can

20   contain the desired number of amino acid residues having free amino groups in

their side chains; however, other functional groups, such as sulfhydryl groups or

hydroxyl groups, can also be used to obtain stable linkages.

Compounds that potently regulate, modulate, or inhibit the protein kinase

activity associated with receptors VEGF, FGF, CDK complexes, TEK, CHK1,

LCK, FAK, and phosphorylase kinase among others, and which inhibit

angiogenesis and/or cellular profileration is desirable and is one preferred

5   embodiment of the present invention. The present invention is further directed to

methods of modulating or inhibiting protein kinase activity, for example in

mammalian tissue, by administering an inventive agent. The activity of the

inventive compounds as modulators of protein kinase activity, such as the activity

of kinases, may be measured by any of the methods available to those skilled in

10   the art, including *in vivo* and/or *in vitro* assays. Examples of suitable assays for

activity measurements include those described in Parast C. et al., *BioChemistry*,

37, 16788-16801 (1998); Jeffrey et al., *Nature*, 376, 313-320 (1995); WIPO

International Publication No. WO 97/34876; and WIPO International Publication

No. WO 96/14843. These properties may be assessed, for example, by using one

15   or more of the biological testing procedures set out in the examples below.

The active agents of the invention may be formulated into pharmaceutical

compositions as described below. Pharmaceutical compositions of this invention

comprise an effective modulating, regulating, or inhibiting amount of a compound

of Formula I, II, III, or IV and an inert, pharmaceutically acceptable carrier or

20   diluent. In one embodiment of the pharmaceutical compositions, efficacious

levels of the inventive agents are provided so as to provide therapeutic benefits

involving modulation of protein kinases. By "efficacious levels" is meant levels in

which the effects of protein kinases are, at a minimum, regulated. These

compositions are prepared in unit-dosage form appropriate for the mode of

administration, e.g., parenteral or oral administration.

An inventive agent is administered in conventional dosage form prepared by

combining a therapeutically effective amount of an agent (e.g., a compound of

5   Formula I) as an active ingredient with appropriate pharmaceutical carriers or diluents

according to conventional procedures. These procedures may involve mixing,

granulating and compressing or dissolving the ingredients as appropriate to the desired

preparation.

The pharmaceutical carrier employed may be either a solid or liquid.

10 Exemplary of solid carriers are lactose, sucrose, talc, gelatin, agar, pectin, acacia,

magnesium stearate, stearic acid and the like. Exemplary of liquid carriers are syrup,

peanut oil, olive oil, water and the like. Similarly, the carrier or diluent may include

time-delay or time-release material known in the art, such as glyceryl monostearate or

glyceryl distearate alone or with a wax, ethylcellulose, hydroxypropylmethylcellulose,

15 methylmethacrylate and the like.

A variety of pharmaceutical forms can be employed. Thus, if a solid carrier is

used, the preparation can be tableted, placed in a hard gelatin capsule in powder or

pellet form or in the form of a troche or lozenge. The amount of solid carrier may

vary, but generally will be from about 25 mg to about 1 g. If a liquid carrier is used,

20 the preparation will be in the form of syrup, emulsion, soft gelatin capsule, sterile

injectable solution or suspension in an ampoule or vial or non-aqueous liquid

suspension.

38

To obtain a stable water-soluble dose form, a pharmaceutically acceptable salt of an inventive agent is dissolved in an aqueous solution of an organic or inorganic acid, such as 0.3M solution of succinic acid or citric acid. If a soluble salt form is not available, the agent may be dissolved in a suitable cosolvent or combinations of

5   cosolvents. Examples of suitable cosolvents include, but are not limited to, alcohol, propylene glycol, polyethylene glycol 300, polysorbate 80, gylcerin and the like in concentrations ranging from 0-60% of the total volume. In an exemplary embodiment, a compound of Formula I is dissolved in DMSO and diluted with water. The composition may also be in the form of a solution of a salt form of the active

10   ingredient in an appropriate aqueous vehicle such as water or isotonic saline or dextrose solution.

It will be appreciated that the actual dosages of the agents used in the compositions of this invention will vary according to the particular complex being used, the particular composition formulated, the mode of administration and the

15   particular site, host and disease being treated. Optimal dosages for a given set of conditions can be ascertained by those skilled in the art using conventional dosage-determination tests in view of the experimental data for an agent. For oral administration, an exemplary daily dose generally employed is from about 0.001 to about 1000 mg/kg of body weight, more preferably from about 0.001 to about 50

20   mg/kg body weight, with courses of treatment repeated at appropriate intervals. Administration of prodrugs are typically dosed at weight levels which are chemically equivalent to the weight levels of the fully active form.

The compositions of the invention may be manufactured in manners generally known for preparing pharmaceutical compositions, e.g., using conventional techniques such as mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing. Pharmaceutical compositions

5   may be formulated in a conventional manner using one or more physiologically acceptable carriers, which may be selected from excipients and auxiliaries that facilitate processing of the active compounds into preparations which can be used pharmaceutically.

Proper formulation is dependent upon the route of administration chosen. For

10   injection, the agents of the invention may be formulated into aqueous solutions, preferably in physiologically compatible buffers such as Hanks's solution, Ringer's solution, or physiological saline buffer. For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

15   For oral administration, the compounds can be formulated readily by combining the active compounds with pharmaceutically acceptable carriers known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use

20   can be obtained using a solid excipient in admixture with the active ingredient (agent), optionally grinding the resulting mixture, and processing the mixture of granules after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients include: fillers such as sugars, including lactose, sucrose, mannitol, or

sorbitol; and cellulose preparations, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, or polyvinylpyrrolidone (PVP). If desired, disintegrating agents may be added, such as crosslinked polyvinyl pyrrolidone, agar,

5   or alginic acid or a salt thereof such as sodium alginate.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, polyvinyl pyrrolidone, Carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or

10   pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active agents.

Pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active

15   ingredients in admixture with fillers such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate, and, optionally, stabilizers. In soft capsules, the active agents may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added. All formulations for oral administration should be in dosages suitable for

20   such administration. For buccal administration, the compositions may take the form of tablets or lozenges formulated in conventional manner.

For administration intranasally or by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol

spray presentation from pressurized packs or a nebuliser, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol the dosage unit may be determined by providing a valve to deliver

5   a metered amount. Capsules and cartridges of gelatin for use in an inhaler or insufflator and the like may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

The compounds may be formulated for parenteral administration by injection, e.g., by bolus injection or continuous infusion. Formulations for injection may be

10   presented in unit-dosage form, e.g., in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents.

Pharmaceutical formulations for parenteral administration include aqueous

15   solutions of the active compounds in water-soluble form. Additionally, suspensions of the active agents may be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils such as sesame oil, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension,

20   such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers or agents which increase the solubility of the compounds to allow for the preparation of highly concentrated solutions.

For administration to the eye, a compound of the Formula I, II, III, or IV is delivered in a pharmaceutically acceptable ophthalmic vehicle such that the compound is maintained in contact with the ocular surface for a sufficient time period to allow the compound to penetrate the corneal and internal regions of the eye,

5   including, for example, the anterior chamber, posterior chamber, vitreous body, aqueous humor, vitreous humor, cornea, iris/cilary, lens, choroid/retina and selera. The pharmaceutically acceptable ophthalmic vehicle may be an ointment, vegetable oil, or an encapsulating material. A compound of the invention may also be injected directly into the vitreous and aqueous humor.

10   Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use. The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, e.g, containing conventional suppository bases such as cocoa butter or other glycerides.

15   In addition to the formulations described above, the compounds may also be formulated as a depot preparation. Such long-acting formulations may be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an

20   acceptable oil) or ion-exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

A pharmaceutical carrier for hydrophobic compounds is a cosolvent system comprising benzyl alcohol, a nonpolar surfactant, a water-miscible organic polymer,

and an aqueous phase. The cosolvent system may be a VPD co-solvent system. VPD

is a solution of 3% w/v benzyl alcohol, 8% w/v of the nonpolar surfactant polysorbate

80, and 65% w/v polyethylene glycol 300, made up to volume in absolute ethanol.

The VPD co-solvent system (VPD:5W) contains VPD diluted 1:1 with a 5% dextrose

5   in water solution. This co-solvent system dissolves hydrophobic compounds well, and

itself produces low toxicity upon systemic administration. Naturally, the proportions

of a co-solvent system may be varied considerably without destroying its solubility

and toxicity characteristics. Furthermore, the identity of the co-solvent components

may be varied: for example, other low-toxicity nonpolar surfactants may be used

10   instead of polysorbate 80; the fraction size of polyethylene glycol may be varied; other

biocompatible polymers may replace polyethylene glycol, e.g. polyvinyl pyrrolidone;

and other sugars or polysaccharides may be substituted for dextrose.

Alternatively, other delivery systems for hydrophobic pharmaceutical

compounds may be employed. Liposomes and emulsions are known examples of

15   delivery vehicles or carriers for hydrophobic drugs. Certain organic solvents such as

dimethylsulfoxide also may be employed, although usually at the cost of greater

toxicity. Additionally, the compounds may be delivered using a sustained-release

system, such as semipermeable matrices of solid hydrophobic polymers containing the

therapeutic agent. Various sustained-release materials have been established and are

20   known by those skilled in the art. Sustained-release capsules may, depending on their

chemical nature, release the compounds for a few weeks up to over 100 days.

Depending on the chemical nature and the biological stability of the therapeutic

reagent, additional strategies for protein stabilization may be employed.

The pharmaceutical compositions also may comprise suitable solid- or gel-phase carriers or excipients. Examples of such carriers or excipients include calcium carbonate, calcium phosphate, sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

5   Some of the compounds of the invention may be provided as salts with pharmaceutically compatible counter ions. Pharmaceutically compatible salts may be formed with many acids, including hydrochloric, sulfuric, acetic, lactic, tartaric, malic, succinic, etc. Salts tend to be more soluble in aqueous or other protonic solvents than are the corresponding free-base forms.

10   The preparation of preferred compounds of the present invention is described in detail in the following examples, but the artisan will recognize that the chemical reactions described may be readily adapted to prepare a number of other protein kinase inhibitors of the invention. For example, the synthesis of non-exemplified compounds according to the invention may be successfully performed by

15   modifications apparent to those skilled in the art, e.g., by appropriately protecting interfering groups, by changing to other suitable reagents known in the art, or by making routine modifications of reaction conditions. Alternatively, other reactions disclosed herein or known in the art will be recognized as having applicability for preparing other compounds of the invention.

20   <u>EXAMPLES</u>

In the examples described below, unless otherwise indicated all temperatures are set forth in degrees Celsius and all parts and percentages are by weight. Reagents were purchased from commercial suppliers such as Aldrich Chemical Company or

Lancaster Synthesis Ltd. and were used without further purification unless otherwise

indicated. Tetrahydrofuran (THF), N,N-dimethylformamide (DMF), dichloromethane,

toluene, and dioxane were purchased from Aldrich in Sure seal bottles and used as

received. All solvents were purified using standard methods readily known to those

5   skilled in the art, unless otherwise indicated.

The reactions set forth below were done generally under a positive pressure of

argon or nitrogen or with a drying tube, at ambient temperature (unless otherwise

stated), in anhydrous solvents, and the reaction flasks were fitted with rubber septa for

the introduction of substrates and reagents via syringe. Glassware was oven dried

10   and/or heat dried. Analytical thin layer chromatography (TLC) was performed on

glass-backed silica gel 60 F 254 plates Analtech (0.25 mm) and eluted with the

appropriate solvent ratios (v/v), and are denoted where appropriate. The reactions

were assayed by TLC and terminated as judged by the consumption of starting

material.

15   Visualization of the TLC plates was done with a p-anisaldehyde spray reagent

or phosphomolybdic acid reagent (Aldrich Chemical 20 wt % in ethanol) and

activated with heat. Work-ups were typically done by doubling the reaction volume

with the reaction solvent or extraction solvent and then washing with the indicated

aqueous solutions using 25% by volume of the extraction volume unless otherwise

20   indicated. Product solutions were dried over anhydrous Na_2SO_4 prior to filtration and

evaporation of the solvents under reduced pressure on a rotary evaporator and noted as

solvents removed *in vacuo*. Flash column chromatography (Still et al., *J. Org. Chem.*,

43, 2923 (1978)) was done using Baker grade flash silica gel (47-61 µm) and a silica

gel: crude material ratio of about 20:1 to 50:1 unless otherwise stated.

Hydrogenolysis was done at the pressure indicated in the examples or at ambient pressure.

^{1}H-NMR spectra were recorded on a Bruker instrument operating at 300 MHz

5   and ^{13}C-NMR spectra were recorded operating at 75 MHz. NMR spectra were obtained as $CDCl_3$ solutions (reported in ppm), using chloroform as the reference standard (7.25 ppm and 77.00 ppm) or CD_3OD (3.4 and 4.8 ppm and 49.3 ppm), or internally tetramethylsilane (0.00 ppm) when appropriate. Other NMR solvents were used as needed. When peak multiplicities are reported, the following abbreviations

10   are used: s (singlet), d (doublet), t (triplet), m (multiplet), br (broadened), dd (doublet of doublets), dt (doublet of triplets). Coupling constants, when given, are reported in Hertz (Hz).

Infrared (IR) spectra were recorded on a Perkin-Elmer FT-IR Spectrometer as neat oils, as KBr pellets, or as $CDCl_3$ solutions, and when given are reported in wave

15   numbers (cm^{-1}). The mass spectra were obtained using LSIMS or electrospray. All melting points (mp) are uncorrected.

Example 1(a): 3-[E-2-(3,4-Dimethoxy-phenyl)vinyl]-6-(3-methoxy-4-hydroxy-phenyl)-1H-indazole
20   The 3-[E/Z-2-(3,4-dimethoxy-phenyl)vinyl]-6-[3-methoxy-4-(methoxymethoxy)phenyl]-1H-indazole (~205 mg, 0.461 mmol (theoretical)) was

dissolved in tetrahydrofuran (THF, 10 mL) and was treated with water (10 mL) and

trifluoroacetic acid (TFA, 20 mL). The reaction mixture was allowed to stir at 23 °C

for 30 minutes (min.). The mixture was diluted with toluene (100 mL) and the

volatile materials were removed under reduced pressure (30 mm Hg, 35 °C) to give a

5   concentrated volume of ~ 5 mL. Again, toluene (100 mL) was added and the mixture

was concentrated under reduced pressure to give crude material which still contained

some acid. The material was partitioned between ethyl acetate and saturated sodium

bicarbonate, the organic material was separated, dried over sodium sulfate, decanted,

and concentrated under reduced pressure. The residue, a mixture of olefin isomers,

10   (~185 mg, 0.461 mmol (theoretical)) was taken up in dichloromethane (50 mL) at 23

°C and was treated with iodine (80 mg). The mixture was allowed to stir at 23 °C for

12 hours (h). The mixture was treated with saturated sodium bicarbonate (10 mL)

and 5% aqueous sodium bisulfite (10 mL). The mixture was diluted with ethyl

acetate (200 mL) and the organic material was washed with saturated sodium

15   bicarbonate (100 mL), dried over sodium sulfate, decanted, and concentrated under

reduced pressure to give crude product. The crude was purified on silica (40 mL, 6:4

-> 7:3 ethyl acetate/hexane) and all fractions containing desired were combined,

concentrated and precipitated from a dichloromethane/hexane bilayer (1:3) to give 3-

[E-2-(3,4-Dimethoxy-phenyl)vinyl]-6-(3-methoxy-4-hydroxy-phenyl)-1H-indazole as

20   a white solid (93 mg combined crops): R_f sm 0.42, p 0.35 (ethyl acetate-hexane 7:3);

5   403.1658. [m-H]/z Calc'd 401. Found 401.

The starting material was prepared as follows:

(i)
To 6-aminoindazole (40.8 g, 0.3065 mol, 1 equiv) in a 2-liter (2-L) round-

10   bottom flask containing a large magnetic stir bar was added ice (256 g), followed by

water (128 mL) and the reaction vessel was lowered into an ice bath. To this stirring

slurry at 0 °C was added concentrated aqueous HCl (128 mL, 1.53 mol, 5 equiv).

Immediately after, a solution of NaNO$_2$ (23.3 g, 0.338 mol, 1.1 equiv) in water (96

mL) was added. After 10 min of stirring at 0 °C, KI (61 g, 0.368 mol, 1.2 equiv) was

15   added very slowly at first (~100 mg at a time because the first small bits of KI cause

an abrupt evolution of gas) then more rapidly (5 min total time). The cold bath was

removed and the reaction mixture was warmed to 40 °C (gas evolved). When the rate

of gas evolution decreased (~30 min) the reaction mixture was warmed to 50 °C for

30 min. The mix was then cooled to 23 °C, and 3N NaOH (320 mL) was added to

20   neutralize followed by 50% saturated NaHCO$_3$ (320 mL). The slurry was then

filtered through a Buchner funnel to give a dark reddish-brown solid. The solid was

taken up in warm THF (800 mL) and silica (600 mL dry) was added with stirring. To

this slurry was added hexane (1.2 L) and the mix was vacuum filtered through a pad

of silica (300 mL) in a large fritted filter. The silica was further washed with 2 L of

40% THF in hexane. The filtrates were combined and concentrated under reduced

pressure to give a solid. The solid was further triturated with ethyl acetate (~100

5   mL), filtered and dried under reduced pressure to give 6-iodo-1H-indazole as a light

brown solid (36.1 g, 48% yield): R_f sm 0.12, p 0.48 (Hex-EtOAc 1:1); ^{1}H NMR

(300 MHz, CDCl$_3$) 7.9 (s, 1H), 7.8 (s, 1H), 7.42 (d, 1H), 7.33 (d, 1H); MS (ES)

[m+H]/z Calc'd 245, Found 245, [m-H]/z Calc'd 243, Found 243.

(ii)

10
To a solution of 6-iodo-1H-indazole (7.35 g, 30.1 mmol, 1 equiv) in THF

(100 mL) cooled to 0 °C under argon, was added sodium *t*-butoxide (2.89 g, 30.1

mmol, 1 equiv). A color change from orange to red was observed.

Mesitylenesulfonyl chloride (6.60 g, 30.1 mmol, 1 equiv) was added in one portion

15   and the ice bath was removed allowing the reaction mixture to warm to 23 °C. After

40 min the mixture was quenched with saturated ammonium chloride and partitioned

between water and ethyl acetate. The aqueous was extracted a total of 3 times with

ethyl acetate. The combined organic material was washed with brine, dried over

sodium sulfate and concentrated under reduced pressure to give 6-iodo-1-(2,4,6-

20   trimethyl-benzenesulfonyl)-1H-indazole as an orange solid (12.8 g, 100% yield, 2:1

mixture). ^{1}H NMR (CDCl$_3$) 8.51 (s, 1H), 7.95 (s, 0.66H, major isomer), 7.91 (s,

0.33H, minor isomer), 7.47 (d, 0.33H, J = 8.4 Hz), 7.29 (d, 0.33H, J = 8.4 Hz), 7.26

(d, 0.66H, J = 8.9 Hz), 7.18 (d, 0.66H, 8.9 Hz), 6.84 (s, 2H), 2.51 (s, 6H), 2.15 (s,

3H).

(iii)
5   A mixture of 6-iodo-1-(2,4,6-trimethyl-benzenesulfonyl)-1H-indazole (5.78 g,

13.56 mmol, 1.00 equiv) and 3-methoxy-4-(methoxymethoxy)benzene-boronic acid

(3.45 g, 16.27 mmol, 1.20 equiv) under argon was dissolved in dioxane (15 mL) and

water (2.0 mL). To this solution was added triethylamine (2.83 mL, 20.3 mmol, 1.5

equiv), potassium carbonate (2.8 g, 20.3 mmol, 1.5 equiv) and

10   dichlorobis(triphenylphosphine)palladium (476 mg, 0.678 mmol, 0.05 equiv). The

reaction mixture was heated to 90 °C for 2 h and then was cooled to 23 °C. The

mixture was separated between ethyl acetate (250 mL) and saturated sodium

bicarbonate (150 mL). The organic material was dried over sodium sulfate, decanted

and concentrated under reduced pressure to give crude 6-(3-methoxy-4-

15   methoxymethoxy-phenyl)-1-(2,4,6-trimethyl-benzenesulfonyl)-1H-indazole that was

dried under high vacuum for 15 h and was used without further purification.

3-Methoxy-4-(methoxymethoxy)benzeneboronic acid was prepared as

follows: In a 100 mL flask a mixture of 50% KOH in water (20 g KOH, 7 equiv, 20 g

ice) was prepared under argon. To this rapidly stirring mixture at 0 °C (maintained

20   with an ice bath) was added dichloromethane (50 mL) followed by 4-bromo-2-

methoxyphenol (10.1g, 50 mmol, 1.00 equiv), methoxymethylchloride (MOMCl)

(4.00 mL, 42.5 mmol, 1.05 equiv) and tetrabutylammonium bromide (322 mg, 1

mmol, 0.02 equiv). The bath was removed and the mixture was slowly allowed to

warm to 23 °C with rapid stirring for 2 h. The mixture is transferred to a separatory

funnel and diluted with dichloromethane (350 mL) and water (300 mL) which are

used to aid the transfer. The organic material (now the bottom layer) are separated,

5   dried over sodium sulfate, decanted and concentrated under reduced pressure to give

4-bromo-2-methoxy-1-(methoxymethoxy)benzene as a yellow liquid which is pure by

^{1}H NMR (11.9 g, 97%): ^{1}H NMR (CDCl$_3$) δ 7.0 (s, 3H), 5.13 (s, 2H), 3.84 (s, 3H),

3.47 (s, 3H). MS (EI) [m+H]/z Calc'd 235, found 235. In a 50 mL round-bottom

flask, 4-bromo-2-methoxy-1-(methoxymethoxy)benzene (4.80 g, 19.4 mmol, 1.00

10   equiv) was taken up in THF (35 mL) and was cooled to -78 °C (20 min for this

volume). To this was added n-BuLi (12.75 mL, 1.6 M in hexane, 20.4 mmol, 1.05

equiv) and the mixture was allowed to stir at -78 °C for 40 min. This was then added

via cannula to a second flask containing B(OMe)$_3$ (22 mL, 194 mmol, 10 equiv) in

THF (50 mL) at -78 °C. After 20 min, the cold bath was removed. After 15 min of

15   warming (~0 °C, ice on the side of the flask begins to melt) water (50 mL) was added

to the reaction mixture which was stirred for 45 min. The mixture was concentrated

under reduced pressure to remove most THF and was then partitioned between ethyl

acetate (300 mL) and water (150 mL) which was made acidic by addition of a small

amount of 20% citric acid (~10 mL). The organic material was dried over sodium

20   sulfate and concentrated under reduced pressure to give a solid. Trituration with

ethyl acetate (10 mL) and hexane (5 mL) followed by filtering gave 3-methoxy-4-

(methoxymethoxy)benzene-boronic acid as a white solid (3.15 g, 77%): R$_f$ sm 0.59,

p 0.18 (ethyl acetate-hexane 1:1); ^{1}H NMR (CDCl$_3$) δ 7.85 (d, 1H, J = 8 Hz), 7.72 (s,

1H), 7.22 (d, 1H, J = 8 Hz), 5.30 (s, 2H), 4.00 (s, 3H), 3.55 (s, 3H).

(iv)
5   Unpurified 6-(3-methoxy-4-methoxymethoxy-phenyl)-1-(2,4,6-

trimethyl-benzenesulfonyl)-1H-indazole (under argon) was dissolved in THF (20 mL)

and was treated with 1N NaOH in MeOH (70 mL degassed by bubbling through

argon for 3 to 5 min). The mixture was heated to 45 °C for 1 h and allowed to cool.

The mixture was neutralized by addition of 1N HCl (50 mL) followed by saturated

10   sodium bicarbonate (200 mL). The product was extracted into ethyl acetate (350

mL), dried over sodium sulfate and concentrated under reduced pressure to give

crude 6-(3-methoxy-4-methoxymethoxy-phenyl)-1H-indazole. Purification by silica

gel chromatography (500 mL silica, 20% ethyl acetate in benzene (1.8 L), 30% ethyl

acetate in benzene (1.8 L)) gave 6-(3-methoxy-4-methoxymethoxy-phenyl)-1H-

15   indazole (1.19 g, 31%): ^{1}H NMR (CDCl$_3$) δ 7.80 (s, 1H), 7.69 (d, 1H, J = 8.5 Hz),

7.52 (s, 1H), 7.29 (d, 1H, J = 8.5 Hz), 7.16 (s, 1H), 7.13 (s, 1H), 7.08 (s, 1H). MS

(ES) [m+Na]/z Calc'd 337, found 337; [m+Cl$^-$]/z Calc'd 349, found 349.

(v)
In a 100-mL round-bottom flask under argon, 6-(3-methoxy-4-

methoxymethoxy-phenyl)-1*H*-indazole (1.19 g, 4.18 mmol, 1 equiv) was dissolved in

dioxane (25 mL) and 3N NaOH (14 mL). This mixture was treated with iodine (1.17

g, 14.60 mmol, 1.10 equiv) added in ~5 portions (~10 min). Several (~4) additional

5   portions of iodine (50 mg each) were added until the reaction was complete as

visualized by TLC (3:7 ethyl acetate/hexane). The mixture was acidified with 20%

citric acid (25 mL) and 5% NaHSO3 (20 mL) was added. The mixture was

partitioned between ethyl acetate (150 mL) and water (100 mL). The organic

material was washed with saturated sodium bicarbonate (80 mL) and brine (50 mL)

10 and were dried over sodium sulfate and concentrated under reduced pressure.

Purification by crystallization from ethyl acetate (3 mL) then hexane (7 mL) gave

pure 3-iodo-6-(3-methoxy-4-methoxymethoxy-phenyl)-1*H*-indazole as a solid (1.33

g, 78 %): ^{1}H NMR (CDCl$_3$) δ 10.48 (bs, 1H), 7.62 (s, 1H), 7.57 (d, 1H, J = 8.5 Hz),

7.47 (dd, 1H, J = 1.3, 8.5 Hz), 7.18 (m, 3H), 5.29 (s, 2H), 3.99 (s, 3H), 3.55 (s, 3H).

15   (vi)
In a 100-mL round-bottom flask, 3-iodo-6-(3-methoxy-4-methoxymethoxy-

phenyl)-1*H*-indazole (921 mg, 2.245 mmol, 1.00 equiv) was dissolved in THF (36

mL) and cooled to -78 °C (allow 8 min at this scale). A solution of PhLi (2.5 mL, 1.8

20 M, 4.49 mmol, 2.00 equiv) was added and the mixture was allowed to stir for 30 min.

A solution of *s*-BuLi (3.63 mL, 4.71 mmol, 2.1 equiv) was added and the reaction

mixture was allowed to stir for 1 h at -78 °C. Neat DMF (1.4 mL, 18 mmol, 8.0

equiv) was added. The cold bath was removed and the reaction was allowed to

slowly warm to 0 °C in the air. As the ice melted saturated sodium bicarbonate (20

mL) was added. The product was extracted into ethyl acetate (200 mL) from

saturated sodium bicarbonate (75 mL more), dried over sodium sulfate, decanted and

5   concentrated under reduced pressure. Purification by silica gel chromatography (450

mL silica, 4:6 ethyl acetate/hexane) gave 6-(3-methoxy-4-methoxymethoxy-phenyl)-

1*H*-indazole-3-carbaldehyde (498 mg, 71%)): R_f sm 0.30, p 0.14 (ethyl acetate-

hexane 4:6); ^{1}H NMR (CDCl$_3$) δ 10.85 (bs, 1H), 10.25 (s, 1H), 8.37 (d, 1H, J = 8.4

Hz), 7.67 (s, 1H), 7.60 (d, 1H, J = 8.4 Hz), 6.26 (d, 1H, J = 8.7 Hz), 7.19 (m, 2H),

10   5.30 (s, 2H), 3.99 (s, 3H), 3.55 (s, 3H).

(vii)

Mts-Cl, DMAP, CH$_2$Cl$_2$
0 °C, 30 min
6-(3-methoxy-4-methoxymethoxy-phenyl)-1*H*-indazole-3-carbaldehyde (441

mg, 1.41 mmol, 1.0 equiv) was taken up as a suspension in dichloromethane (15 mL)

15   and was cooled to 0 °C. This mixture was treated with mesitylene sulfonyl chloride

(324 mg, 1.48 mmol, 1.05 equiv) and dimethylamino pyridine (DMAP) (181 mg,

1.48 mmol, 1.05 equiv). The mixture was allowed to stir for 1 h at 0 °C and was

quenched with the addition of water. The mixture was partitioned between water and

a 1:1 ethyl acetate/hexane organic layer. The organic material was dried over sodium

20   sulfate, decanted and concentrated under reduced pressure to give crude material

which was purified by silica gel chromatography (50 mL silica, 3:7 ethyl

acetate/hexane) to give 6-(3-methoxy-4-methoxymethoxy-phenyl)-1-(2,4,6-trimethyl-

benzenesulfonyl)-1*H*-indazole-3-carbaldehyde (374 mg, 54%): R*f* sm 0.17, p 0.53

(ethyl acetate-hexane 4:6); ^{1}H NMR (CDCl3) δ 10.20 (s, 1H), 8.41 (s, 1H), 8.37 (d,

1H, J = 8.5 Hz), 7.73 (dd, 1H, J = 1.4, 8.4 Hz), 7.3 (m, 3H), 7.08 (s, 2H), 5.36 (s, 2H),

4.08 (s, 3H), 3.71 (s, 3H), 2.74 (s, 6H), 2.40 (s, 3H).

5   (viii)
Finely ground triphenyl(3,4-dimthoxybenzyl)phosphonium bromide (1.09 g,

2.22 mmol, 4.0 equiv) was taken up as a slurry in THF (15 mL) and was cooled to -

78 °C. To this mixture was added *n*-BuLi (1.04 mL, 1.6 M, 1.66 mmol, 3.0 equiv)

10   which gave a red/orange solution. The mixture was allowed to warm to 23 °C for 1

h. This mixture was then added to a 0 °C solution of 6-(3-methoxy-4-

methoxymethoxy-phenyl)-1-(2,4,6-trimethyl-benzenesulfonyl)-1*H*-indazole-3-

carbaldehyde (274 mg, 0.554 mmol, 1.0 equiv) in THF (5 mL) via cannula. The

resulting mixture was allowed to stir at 0 °C for 10 min and was quenched with

15   saturated sodium bicarbonate. The resulting mixture was partitioned between

saturated sodium bicarbonate and ethyl acetate. The organic material was

concentrated under reduced pressure and the residue was purified by silica gel

chromatography (50 mL silica, 3:7 -> 4:6 ethyl acetate/hexane) to give a 2.5:1

mixture of cis/trans 3-[2-(3,4-dimethoxy-phenyl)-vinyl]-6-(3-methoxy-4-

20   methoxymethoxy-phenyl)-1-(2,4,6-trimethyl-benzenesulfonyl)-1*H*-indazole (289 mg,

83%): R*f* sm 0.53, p 0.32 (ethyl acetate-hexane 4:6); ^{1}H NMR (CDCl3) δ 8.35 (s,

Example 2(a): 3-(Naphthalen-2-yl)-6-(3-methoxy-4-hydroxy-phenyl)-1*H*-indazole
6-(4-Benzyloxy-3-methoxy-phenyl)-3-naphthalen-2-yl-1*H*-indazole (25 mg,

5   0.055 mmol) was dissolved in a mixture of ethyl acetate (2 mL), benzene (2 mL) and

methanol (2 mL). To this solution was added palladium on carbon (25 mg, 10% wt)

and the reaction vessel was vacuum/purged with hydrogen gas for five cycles. The

reaction mixture was allowed to stir for 3 days (d) at 23 °C and was filtered through a

plug of Celite. Concentration and purification by silica gel chromatography afforded

10   3-(Naphthalen-2-yl)-6-(3-methoxy-4-hydroxy-phenyl)-1*H*-indazole (8 mg, 40%): ^{1}H

NMR (CDCl₃) δ 10.3 (bs, 1H), 8.50 (s, 1H), 8.20 (d, 1H, J = 8 Hz), 7.98 (d, 1H, J =

8Hz), 7.90 (m, 1H), 7.7-6.8 (m, 9H), 3.98 (s, 3H). MS (ES) [m+H]/z Calc'd 367,

found 367, [m-H]/z Calc'd 365, found 365.

The starting material was prepared as follows:

15   (i)
2-Bromonaphthalene (117 mg, 0.564 mmol, 6.0 equiv) was dissolved in THF

(0.75 mL) and cooled to -78 °C. The mixture was treated with *n*-BuLi (226 μL, 2.5

M, 6.0 equiv) and was allowed to stir at -78 °C for 30 min. The mixture was then

added to freshly dried ZnCl$_2$ solid (139 mg, 0.80 mmol, 8.5 equiv) via cannula and

the resulting mix was allowed to warm to 23 °C (during the addition the yellow color

disappears). After 30 min at 23 °C the mixture is added to a mixture of 6-(4-

5   benzyloxy-3-methoxy-phenyl)-3-iodo-1-(2,4,6-trimethyl-benzenesulfonyl)-1H-

indazole (60 mg, 0.094 mmol, 1 equiv) and Pd(PPh$_3$)$_4$ (6 mg, 0.005 mmol, 0.05

equiv) via cannula. The resulting solution was allowed to stir for 16 h. Saturated

sodium bicarbonate was added and the mixture was partitioned between saturated

sodium bicarbonate (15 mL) and ethyl acetate (15 mL). The organic material was

10 dried over sodium sulfate, decanted and concentrated. Purification by silica gel

chromatography (1:9 -2:8 ethyl acetate-hexane) gave 6-(4-benzyloxy-3-methoxy-

phenyl)-3-naphthalen-2-yl-1-(2,4,6-trimethyl-benzenesulfonyl)-1H-indazole as a

solid (42 mg, 70%): R$_f$ sm 0.4, p 0.4 (ethyl acetate-hexane 3:7); ^{1}H NMR (CDCl$_3$) δ

8.44 (s, 1H), 8.41 (s, 1H), 8.12 (d, 1H, J = 8 Hz), 8.05-7.00 (m, 17H), 5.30 (s, 2H),

15 4.02 (s, 3H), 2.80 (s, 3H), 2.34 (s, 3H).

6-(4-benzyloxy-3-methoxy-phenyl)-3-iodo-1-(2,4,6-trimethyl-

benzenesulfonyl)-1H-indazole was prepared in a similar manner as described in

Example 1(a), steps (i) to (v).

(ii)
20

6-(4-Benzyloxy-3-methoxy-phenyl)-3-naphthalen-2-yl-1-(2,4,6-trimethyl-

benzenesulfonyl)-1*H*-indazole was converted to 6-(4-benzyloxy-3-methoxy-phenyl)-

3-naphthalen-2-yl-1*H*-indazole as described in Example 1(a), step (ix). R*f* sm 0.40, p

0.17 (ethyl acetate-hexane 3:7); ^{1}H NMR (CDCl$_3$) δ 8.40 (s, 1H), 8.12 (d, 1H, J = 8.5

5   Hz), 8.10 (dd, 1H, J = 1.6, 8.4 Hz), 7.93 (d, 1H, J = 8.3 Hz), 7.88 (m, 2H), 7.61 (m,

1H) 7.56 (s, 1H), 7.43 (m, 5H), 7.30 (m 3H), 7.15 (d, 1H, J = 2.0 Hz), 7.08 (dd, 1H, J

= 2.1, 8.3 Hz), 6.91 (d, 1H, J = 8.3 Hz), 5.16 (s, 2H), 3.91 (s, 3H).

Example 2(b): 3-phenyl-6-(3-methoxy-4-hydroxy-phenyl)-1*H*-indazole

10
Example 2(b) was prepared in a similar manner to that described for Example

2(a), except that phenyllithium was used in place of 2-napthyllitium generated from

2-bromonaphthylene in step (i). ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.87 (d, 1H), 7.83 (d,

2H), 7.55-7.27 (m, 5H), 7.01 (m, 2H), 6.80 (d, 1H), 3.83 (s, 3H). MS (ES) [m+H]/z

15   Calc'd 317, Found 317, [m-H]/z Calc'd 315, found 315.

Example 2(c): 3-(3,4,5-trimethoxyphenyl)-6-(3-methoxy-4-hydroxy-phenyl)-1*H*-

indazole
Example 2(c) was prepared in a similar manner to that described for Example

2(a), except that 3,4,5-trimethoxyphenyl bromide was used in step (i) in place of 2-

bromonaphthylene. R_f sm 0.67, p 0.38 (ethyl acetate-hexane 8:2); ^{1}H NMR (CDCl$_3$)

δ 7.93 (d, 1H, J = 8 Hz), 7.58 (s, 1H), 7.39 (d, 1H, J = 8 Hz), 7.10 (m, 4H), 6.92 (d,

5   1H, J = 8 Hz), 3.90 (s, 9H), 3.85 (s, 3H); MS (ES) [m+H]/z Calc'd 407, Found 407,

[m-H]/z Calc'd 405, Found 405.

Example 2(d): 3-(1H-Indol-2-yl) -6-(3-methoxy-4-hydroxy-phenyl)-1H-indazole
Example 2(d) was prepared in a similar manner to that described for Example

10   2(a) above, except that 1-phenylsulfonyl-indazole was used in place of 2-

bromonaphthylene in step (i). R_f sm 0.20, p 0.15 (ethyl acetate-hexane 4:6); ^{1}H

NMR (CDCl$_3$) δ 10.0 (bs, 1H), 9.05 (bs, 1H), 8.01 (d, 1H, J = 8.0 Hz), 7.55 (d, 1H, J

= 8.0 Hz), 7.49 (s, 1H), 7.37 (d, 1H, J = 8 Hz), 7.29 (d, 1H, J = 8 Hz), 7.2-7.1 (m,

5H), 6.92 (d, 1H, J = 8 Hz), 5.63 (bs, 1H); MS (ES) [m+H]/z Calc'd 356, Found 356;

15   [m-H]/z Calc'd 354, found 354.

Example 2(e): 3-(Benzofuran-2-yl)-6-(3-benzyloxy-4-hydroxy-phenyl)-1H-

indazole
Example 2(e) was prepared in a similar manner to that described for Example

2(a) above, except that benzofuran was used in place of 2-bromonaphthylene in step

(i). ^{1}H NMR (CDCl$_3$) δ 8.21 (d, 1H, J = 8.0 Hz), 7.60 (m, 3H), 7.30-7.10 (m, 12H),

7,01 (d, 1H, J = 8 Hz), 5.82 (bs, 1H), 5.15 (s, 3H).

5   **Example 3: 3-(1*H*-Indol-2-yl) -6-(3-methoxy-4-hydroxy-phenyl)-1*H*-indazole**
3-(1*H*-Benzoimidazol-2-yl)-6-(3-methoxy-4-methoxymethoxy-phenyl)-1*H*-

indazole was converted to 4-[3-(1*H*-benzoimidazol-2-yl)-1*H*-indazol-6-yl]-2-

methoxy-phenol according to the procedure described in Example 1(a) (3.5 mg,

10   28%). HRMS (FAB) [m+H]/z Calc'd 357.1351, Found 357.1349.

The starting material was prepared as follows:
6-(3-Methoxy-4-methoxymethoxy-phenyl)-1*H*-indazole-3-carbaldehyde (from

Example 1(a), step (vi)) (20 mg, 0.064 mmol, 1 equiv) was dissolved in degassed 1:1

15   MeOH-water (0.7 mL) and was treated with acetic acid (19 μL, 5 equiv), 1,2-

diaminobenzene (8.3 mg, 1.2 equiv) and copper(II) acetate (18 mg, 1.4 equiv) at 23

°C. The mixture stirred for 30 min, was diluted with ethanol (3 mL) and water (2

mL) and was treated with a bubbling stream of SH$_2$ for 3 min, which gave a black

precipitate. The mixture was allowed to stir for 12 h. The mixture was filtered and

concentrated. Purification by silica gel chromatography (6:4 ethyl acetate-hexane)

gave 3-(1*H*-benzoimidazol-2-yl)-6-(3-methoxy-4-methoxymethoxy-phenyl)-1*H*-

indazole as a solid (14 mg, 54%); R$_f$ sm 0.39, p 0.24 (ethyl acetate-hexane 6:4); [1]H

NMR (CDCl$_3$) δ 8.69 (d, 1H, J = 8Hz), 7.70 (bs, 2H), 7.58 (s, 1H), 7.53 (d, 1H, J = 8

5   Hz), 7.30-7.15 (m, 7H), 5.30 (s, 2H), 3.97 (s, 3H), 3.58 (s, 3H); MS (ES) [m+H]/z

Calc'd 401, found 401, [m-H]/z Calc'd 399, found 399.

Example 4(a): *N*-[3-(3-Styryl-1H-indazol-6-yloxy)-phenyl]-benzamide
A solution of N-[3-(2-benzoyl-3-styrl-1H-indazol-6-yloxy)-phenyl]-

10   benzamide (0.09 g, 0.17 mmol) in 2 mL of 6N HCl (aqueous) and 3 mL of MeOH

was heated at 65 °C for about 4 h. The cooled solution was poured cautiously into

saturated sodium bicarbonate solution. The precipitate was filtered, collected and

chromatographed on silica gel eluting hexanes/EtOAc (1:1). *N*-[3-(3-Styryl-1H-

indazol-6-yloxy)-phenyl]-benzamide was obtained as a beige solid (32 mg, 50%): [1]H

15   NMR (DMSO-d$_6$) δ 13.50 (s, 1H), 10.32 (s, 1H), 8.23 (d, 1H, J = 8.7 Hz), 7.92 (d, 2H,

J = 6.8 Hz), 7.72 (d, 2H, J = 7.3 Hz), 7.71-7.51 (m, 7H), 7.51 – 7.47 (m, 3H), 7.30 (t,

1H, J = 7.2 Hz), 7.05 (s, 1H), 7.01 (d, 1H, J = 8.7 Hz), 6.86 (dd, 1H, J = 8.2, 2.3 Hz).

Anal. Calc. for C$_{28}$H$_{21}$N$_3$O$_2$ 0.3H$_2$O: C, 76.97; H, 4.98: N, 9.62. Found: C, 76.94; H,

5.13; N, 9.40.

20   The starting material was prepared as follows:

(i)
A suspension of the 3-(benzhydrylidene-amino)-phenol (10.47 g, 38.3 mmol),

3-chloro-cyclohex-2-enone (5.00 g, 38.3 mmol) and potassium carbonate (5.82, 42.1

mmol) in 150 mL of acetone was heated at reflux overnight. The cooled reaction

5   mixture was filtered and concentrated under reduced pressure. The residue was

chromatographed on silica gel eluting hexanes/EtOAc (2:1). In this manner, 3-[3-

(benzhydrylidene-amino)-phenoxy]-cyclohex-2-enone was obtained as a yellow

solid, (8.82 g, 63%): ^{1}H NMR (CDCl$_3$) δ 7.78 (d, 2H, J = 7.0 Hz), 7.50 (d, 1H, J = 7.1

Hz), 7.45 (d, 2H, J = 7.7 Hz), 7.34-7.10 (m, 6H), 6.69 (d, 1H, J = 8.0 Hz), 6.61 (d,

10   1H, J = 8.0 Hz), 6.38 (s, 1H), 4.89 (s, 1H), 2.55 (t, 2H, J = 6.2 Hz), 2.34 (t, 2H, J =

6.2 Hz), 2.06 (m, 2H). Anal. Calc. for C$_{25}$H$_{21}$NO$_2$·0.2H$_2$O: C, 80.92; H, 5.81; N, 3.78.

Found: C, 81.12; H, 5.81; N, 3.72.

3-(Benzhydrylidene-amino)-phenol was prepared as follows: A stirred

solution of benzophenone imine (15.0 g, 82.8 mmol) and 3-aminophenol (9.03 g,

15   82.8 mmol) in 25 mL toluene was heated at reflux with removal of H$_2$O with a Dean-

Stark trap for 3.5 h. The crystals that formed from the cooled reaction mixture were

collected by vacuum filtration, washed with hexanes and air dried. In this manner, 3-

(benzhydrylidene-amino)-phenol was obtained as a light yellow solid (17.3 g, 76%):

^{1}H NMR (CDCl$_3$) δ 7.64 (d, 2H, J = 7.1 Hz), 7.38 (d, 1H, J = 7.1 Hz), 7.34 – 7.15 (m,

20   7H), 7.04 (d, 2H, J = 7.2 Hz), 6.88 (t, 1H, J = 8.1 Hz), 6.82 (d, 1H, J = 8.2 Hz), 6.23

(s, 1H), 6.21 (d, 1H, J = 7.8 Hz). Anal. Calc. for $C_{19}H_{15}NO$: C, 83.49; H, 5.53; N,

5.12. Found: C, 83.51; H, 5.65; N, 5.03.

(ii)
5   A solution of 3-[3-(benzhydrylidene-amino)-phenoxy]-cyclohex-2-enone

(4.37g, 11.89 mmol) in 20 mL of THF was added slowly to a solution of LiHMDS

(25.0 mL of 1.0 M solution in THF) in 10 mL of THF at –78 °C. Five minutes after

the addition was complete trans-cinnamoyl chloride (1.98 g, 11.89 mmol) was added

all at once, and stirring was continued at –78 °C for 30 min. The reaction was

10   quenched with saturated NH_4Cl solution. And extracted with EtOAc (2x). The

combined organic layers were washed with saturated NaCl solution, dried ($MgSO_4$)

and concentrated under reduced pressure. The residue was chromatographed on silica

gel eluting hexanes/EtOAc (5:1). In this manner, 3-[3-(benzhydrylidene-amino)-

phenol]–6–(3-phenyl-acryloyl)-cyclohex-2-enone was obtained as a yellow-orange

15   solid (3.34 g, 56%): ^{1}H NMR(CDCl$_3$) δ: 15.69 (s, 1H), 7.80 (d, 2H, J = 7.1 Hz), 7.63-

7.01 (m, 15H), 6.93 (d, 1H, J = 15.6 Hz), 6.75 (d, 1H, J = 7.6 Hz), 6.66 (d, 1H, J = 8.0

Hz), 6.46 (s, 1H), 4.92 (s, 1H), 2.85 (t, 2H, J = 7.2 Hz), 2.62 (t, 2H, J = 7.2 Hz).

Anal. Calc. for $C_{34}H_{27}NO_3$: C, 82.07; H, 5.47; N, 2.82. Found: C, 81.88; H, 5.53; N,

2.81.

20   (iii)
To a stirred solution of 3-[3-(benzhydrylidene-amino)-phenol]–6–(3-phenyl-

acryloyl)-cyclohex-2-enone (1.81 g, 3.64 mmol) dissolved in 10 mL of

HOAc/EtOH(1:1) was added hydrazine hydrate (2.0 mL, 41.23 mmol). The solution

5   was heated at 75 °C for 25 min. After cooling, the reaction mixture was cautiously

poured into saturated sodium bicarbonate solution and extracted with EtOAc (2x).

The combined organic layer was washed with saturated NaCl solution, dried (MgSO₄)

and concentrated under reduced pressure. The residue was chromatographed on silica

gel eluting hexanes/EtOAc (1:1). 3-(3-Styryl-4, 5-dihydro-1H-indazol-6-yloxy)-

10   phenylamine was obtained as a yellow solid (539 mg, 45%). ^{1}H NMR (DMSO-d₆) δ

7.55 (d, 2H, J = 7.2Hz), 7.38 (t, 2 H, J = 7.2 Hz), 7.27 (t, 1H, J = 7.2 Hz), 7.05 (m,

3H), 6.38 (d, 1H, J = 8.0 Hz), 6.31 (s, 1H), 6.23 (d, 1H, J = 7.9 Hz), 5.52 (s, 1H), 5.26

(s, 2H), 2.92 (t, 2H, J = 8.0 Hz), 2.58 (t, 2H, J = 8.1 Hz). Anal. Calc. for C₂₁H₁₉N₃O ·

0.3H₂O: C, 75.33; H, 5.90; N, 12.55. Found: C, 75.46; H, 5.96; N, 12.35.

15   (iv)
To a stirred solution of 3-(3-styryl-4, 5-dihydro-1H-indazol-6-yloxy)-

phenylamine (50 mg, 0.15 mmol) and N,N-diisopropylethylamine (54 µl, 0.31 mmol)

in 5 mL of CH₂Cl₂, was added benzoyl chloride (36 µl, 0.31 mmol). After 15 min, the

reaction mixture was diluted with CH_2Cl_2 and washed sequentially with 0.5N HCl,

saturated sodium bicarbonate solution and brine, dried ($MgSO_4$) and concentrated

under reduced pressure. To a stirred solution of the residue in 1,4-dioxane was added

2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) (35 mg, 0.15 mmol). After 1 h,

5   the reaction mixture was concentrated under reduced pressure and the residue was

chromatographed on silica gel eluting hexanes/EtOAc (2:1). In this manner, N-[3-(2-

benzoyl-3-styrl-1H-indazol-6-yloxy)-phenyl]-benzamide was prepared as a rust

colored solid (90 mg, ~quantitative): ^{1}H NMR ($CDCl_3$) δ 8.13 (s, 1H), 8.02 (d, 2H, J

= 7.0 Hz), 7.94 (d, 1H, J = 8.7 Hz), 7.74 (d, 2H, J = 6.8 Hz), 7.57-7.19 (m, 17H), 6.84

10   (d, 1H, J = 8.3 Hz).

Example 4(b): N-[3-(3-Styryl-1H-indazol-6-yloxy)-phenyl]-acetamide
Example 4(b) was prepared in a similar manner to that described for Example

4(a) above, except that acetic anhydride was used instead of benzoyl chloride in step

15   (iv). ^{1}H NMR(DMSO-d_6) δ 13.08 (bs, 1H), 10.03 (s, 1H), 8.22 (d, 1H, J = 8.7 Hz),

7.72(d, 2H, J = 7.3 Hz), 7.52 (s, 2H), 7.44-7.27 (m, 6H), 7.01 (s, 1H), 6.96 (dd, 1H, J

= 8.7, 2.1 Hz), 6.78 (d, 1H, J = 6.9 Hz), 2.01 (s, 3H). Anal. Calc. for $C_{23}H_{19}N_3O_2$ ·

0.25 H_2O: C, 73.88; H, 5.26; N, 11.24. Found: C, 74.20; H, 5.57; N, 10.82.

Example 5(a): 5-Methyl-thiazole-2-carboxylic acid {3-(3- styryl -1H-indazol-6-

20   **yloxy)-phenyl]-amide**
A suspension of 5-methyl-thiazole-2-carboxylic acid {3-[1-(5-methyl-

thiazole-2-carbonyl)-3-styryl-1*H*-indazol-6-yloxyl-phenyl}amide (57 mg, 0.10 mmol)

and potassium carbonate (50 mg, 0.36 mmol) in MeOH was stirred at 23 °C for 20

5   min. The solution was filtered, diluted with EtOAc and washed with brine (2x). The

organic layer was dried (MgSO$_4$) and concentrated under reduced pressure. In this

manner, 5-methyl-thiazole-2-carboxylic acid {3-(3- styryl -1H-indazol-6-yloxy)-

phenyl]-amide was prepared as a tan solid in 47% yield.: ^{1}H NMR (DMSO-d$_6$) δ

13.00 (s, 1H), 10.80 (s, 1H), 8.23 (d, 1H, J = 8.8 Hz), 7.79 (s, 2H), 7.71 (t, 2H, J = 8.6

10   Hz), 7.53 (s, 2H), 7.41-7.27 (m, 5H), 7.04 (s, 1H), 7.00 (d, 1H, J = 8.7 Hz), 6.89 (d,

Example 6(a):　N-(3-{3-[2-(4-Chloro-phenyl)-vinyl]-1H-indazol-6-yloxy}-phenyl)-

15　　**benzamide**
Starting from N-(3-{1-benzoyl-3-[2-(4-chloro-phenyl)-vinyl]-1H-indazol-6-

yloxyl}-phenyl)-benzamide, the general procedure for example 5(a) was used to

prepare the title compound as an off-white solid in 72% yield: ¹H NMR (DMSO-d₆) δ

13.07 (s, 1H), 10.32 (s, 1H), 8.24 (d, 1H, J = 8.8 Hz), 7.92 (d, 2H, J = 7.1 Hz), 7.76

(d, 2H, J = 8.5 Hz), 7.59-740 (m, 10H), 7.05 (s, 1H), 7.00 (d, 1H, J = 8.7 Hz), 6.87 (d,

1H, J = 7.9 Hz). Anal. Calc. for $C_{28}H_{20}ClN_3O_2 \cdot 0.4H_2O \cdot 0.15$ hexanes; C, 71.41; H,

5   4.75; N, 8.65. Found: C, 71.62; H, 14.83; N, 8.45.

The starting material was prepared as follows:

(i)
Starting with 3-[3-(benzhydrylidene-amino)-phenoxy]-cyclohex-2-enone and

10 3-(4-chloro-phenyl)-acryloyl chloride (prepared as described below), the general

procedure for Example 4(a), step (ii) was employed. The product was used without

purification in the hydrazine cyclization procedure, Example 4(a) step (iii), to give 3-

{3-[2-(4-chloro-phenyl)-vinyl]-4,5-dihydro-1H -indazol-6-yloxyl}-phenylamine as a

yellow solid in 30% yield. ¹H NMR (DMSO-d₆) δ 12.45 (s, 1H), 7.58 (d, 2H, J = 8.5

15 Hz), 7.43 (d, 2H, J = 8.5 Hz), 5.52 (s, 1H), 5.26 (s, 2H), 2.92 (t, 2H, J = 8.0 Hz), 2.58

(t, 2H, J = 8.0 Hz). Anal. Calc. for $C_{21}H_{18}ClN_3O \cdot 0.75H_2O$: C, 66.84; H, 5.21; N,

11.14. Found: C, 66.73; H, 4.89; N, 11.01.

3-(4-chloro-phenyl)-acryloyl chloride was prepared as follows: To a stirred

suspension of 4-chloro-trans-cinnamic acid (2.51 g, 13.77 mmol) in benzene was

20 added thionyl chloride (1.1 mL, 15.14 mmol) and a catalytic amount of DMAP. The

reaction mixture was heated at reflux for 1.5 h. The volatile materials were removed

under reduced pressure. The white residue was dissolved in Et$_2$O and concentrated

again under reduced pressure, to give 3-(4-chloro-phenyl)-acryloyl chloride (2.78 g,

quantitative) as a white solid: ^{1}H NMR (CDCl$_3$) δ 7.81 (d, 1H, J = 15.6 Hz), 7.54 (d,

2H, J = 8.6 Hz), 7.44 (d, 2H, J = 8.6 Hz), 6.65 (d, 1H, J = 15.6 Hz).

5   (ii)
3-{3-[2-(4-Chloro-phenyl)-vinyl]-4,5-dihydro-1H-indazol-6-yloxyl}-

phenylamine was converted into N-(3-{1-benzoyl-3-[2-(4-chloro-phenyl)-vinyl]-1H-

indazol-6-yloxyl}-phenyl)-benzamide by the procedure described in Example 4(a),

10   step (iv) (85% yield). ^{1}H NMR (DMSO-d$_6$) δ 10.37 (s, 1H), 8.43 (d, 1H, J = 8.8 Hz),

8.00-7.39 (m, 21H), 7.34 (d, 1H, J = 8.8 Hz), 6.93 (d, 1H, J = 8.8 Hz).

Example 6(b): N-{3-[3-(2-Indolyl)-1H-indazol-6-yloxy]-phenyl}-3-methyl-

benzamide
15   Example 6(b) was prepared in a similar manner to that described for Example

6(a) above, except that 1-SEM-indazole-2-carboxylic acid was used in step (i) in

place of 4-chlor-*trans*-cinnamic acid. ^{1}H NMR (DMSO-d$_6$) δ 13.19 (s, 1H), 11.59 (s,

1H), 10.29 (s,1H), 8.23 (d, 1H, J = 8.7 Hz), 7.73-7.38 (m, 9H), 7.12 (s,1H), 7.03 (d,

2H, J = 7.3 Hz), 6.88 (d, 1H, J = 7.8 Hz), 2.38 (s, 1H). HRMS [m+H]/z Calc'd:

459.1821, found 459.1836.

Example 7: 3-(Styryl-1H-indazol-6-yloxy)-phenylamine
5   A suspension of 3-(3-styryl-4, 5-dihydro-1H-indazol-6-yloxy)-phenylamine

(75 mg, 0.23 mmol) and 90 mg of 5% palladium on carbon (Pd/C) was heated at 155

°C. After 4 h, more 5% Pd/C (39 mg) was added. After 22 h, more 5%Pd/C (30 mg)

was added. The reaction mixture was filtered while hot after 26 h. The catalyst was

washed and the filtrate concentrated under reduced pressure. The residue was

10   chromatographed on silica eluting hexanes/EtOAc (1:1). The appropriate fractions

were concentrated and triturated with CH_2Cl_2/hexanes to give the title compound as

an off-white solid (20 mg, 27%): ^{1}H NMR (DMSO-d_6) δ 8.16 (d, 1H, J = 8.5 Hz),

7.71 (d, 2H, J = 6.7 Hz), 7.50 (s, 2H), 7.40 (t, 2H, J = 7.0 Hz), 7.30 (d, 1H, J = 6.5

Hz), 7.06-6.92 (m, 3H), 6.35 (d, 1H, J = 8.3 Hz), 6.23 (s, 2H), 5.26 (s, 2H). Anal.

15   Calc. for $C_{21}H_{17}N_3O \cdot 0.15CH_2Cl_2$: C, 74.69; H, 5.13; N, 12.36. Found: C, 74.64; H,

5.23; N, 12.25.

Example 8(a): 3-(E-styryl)-6-phenoxy-1H-indazole
        A suspension of 3-(E-styryl)-6-phenoxy-4,5-dihydro-1H-indazole (200 mg.

20   0.64 mmol) and 5% Pd/C (200 mg) in 10 mL of tetralin was heated at 155 °C for 18

h. The catalyst was removed by filtering the hot solution and washed with THF,

EtOAc and MeOH. The filtrate was concentrated under reduced pressure and the

residue was chromatographed on silica gel eluting hexanes/EtOAc (2:1) to provide 3-

(E-styryl)-6-phenoxy-1H-indazole as an off-white solid (110 mg, 55%). ^{1}H NMR

5   (DMSO-d$_6$) δ 6.96 (s, 2H), 7.10 (d, 2H, J = 7.7 Hz), 7.20 (t, 1H, J = 7.1 Hz), 7.30 (t,

1H, J = 7.1 Hz), 7.44 (m, 6H), 7.71 (d, 2H, J = 7.5 Hz), 8.20 (d, 1H, J = 9.2 Hz),

12.90 (s, 1H). Anal. Calc. for $C_{21}H_{16}N_2O \cdot 0.1H_2O$: C, 80.28; H, 5.20; N, 8.92.

Found: C, 80.20; H, 5.21; N, 8.93.

The starting material was prepared as follows:

10   (i) To a stirred solution of 3-chloro-cyclohex-2-enone (3.00g, 23.0 mmol) and

phenol (2.16 g, 23.0 mmol) in 25 mL of acetone was added powdered, anhydrous

K$_2$CO$_3$ (3.81 g, 27.6 mmol). After refluxing for 18 h, the mixture was cooled and

filtered. The filtrate was concentrated under reduced pressure and chromatographed

on silica gel eluting with hexanes/EtOAc (4:1) to give 3-phenoxy-cyclohex-2-enone

15   as a white solid: ^{1}H NMR (CDCl$_3$) δ 2.10 (quint, 2H, J = 6.3 Hz), 2.40 (t, 2H, J = 6.2

Hz), 2.68 (t, 2H, J = 6.3 Hz), 5.14 (s,1H), 7.05 (d, 2H, J = 7.5 Hz), 7.26 (t, 1H, J =

7.3 Hz), 7.41 (t, 2H, J = 7.6 Hz).

(ii) A solution of 3-phenoxy-cyclohex-2-enone (301 mg, 1.6 mmol) in 1 mL

of THF was added to a stirred solution of 1.0 M solution of lithium

20   bis(trimethylsilyl)amide in THF (3.2 mL) at –78°C. After 15 min, cinnamoyl chloride

(266 mg, 1.6 mmol) was added all at once. After 15 min, the reaction mixture was

poured into 0.5 N HCl and extracted with EtOAc (2x). The combined organic layers

were washed with saturated NaCl solution, dried (MgSO$_4$), filtered, and concentrated

under reduced pressure. Chromatography of the residue with 4:1 hexanes/ethyl

acetate as eluant provided 220 mg (43%) of 3-phenoxy-6-(3-phenyl-acryloyl)-

cyclohex-2-enone as a yellow solid (220 mg, 43%): ^{1}H NMR (CDCl$_3$) (enol form) δ

2.66 (t, 2H, J = 7.2 Hz), 2.84 (t, 2H, J = 7.1 Hz), 5.11 (s, 1H), 6.86 (d, 1H, J = 15.6

5   Hz), 7.02 (d, 2H, J = 8.1 Hz), 7.20 (m,2H), 7.28-7.38 (m, 3H). HRMS M+H$^+$ calc:

319.1334, found 319.1340.

(iii) To a stirred solution of 3-phenoxy-6-(3-phenyl-acryloyl)-cyclohex-2-

enone (1.13 g, 3.55 mmol) in 20 mL of HOAc/EtOH(1:1) was added hydrazine

monohydrate (.21 mL, 4.3 mmol). The reaction was heated at 70 °C for 3 h, cooled

10   and poured cautiously into saturated Na HCO$_3$ solution and extracted with EtOAc

(2x). The combined organic layers were washed with saturated NaCl solution, dried

(MgSO$_4$) and concentrated under reduced pressure. The residue was

chromatographed on silica gel eluting hexanes/EtOAc (2:1) to give 6-phenoxy-3-

styryl-4,5-dihydro-1H-indazole (3) as an off-white solid (406 mg, 36%): ^{1}H NMR

15   (DMSO-d$_6$) δ 2.64 (t, 2H, J = 8.0 Hz), 2.95 (t, 2H, J = 8.0 Hz), 5.46 (s,1H), 7.04 (AB,

2H, J = 16.8 Hz), 7.15 (d, 2H, J = 8.1 Hz), 7.25 (m, 2H), 7.42 (m, 4H), 7.55 (d, 2H, J

= 7.7 Hz), 12.44 (s, 1H). Anal. Calc. for C$_2$H$_{18}$N$_2$O·0.2H$_2$O: C, 79.32; H, 5.83, N,

8.81. Found: C, 79.36; H, 5.85; N, 8.84.

Example 8(b): 3-(E-styryl)-6-[4-(methoxymethoxy)phenoxy]-1H-indazole

20
Example 8(b) was prepared in a similar manner to that described for Example

8(a) above, except that 4-(methoxymethoxy)phenol was used in place of phenol in

step (i). ^{1}H NMR (DMSO-d$_6$) δ 12.90 (s, 1H), 8.17 (d, 1H, J = 8.8 Hz), 7.71 (d, 2H, J

Example 10: 6-(1-Phenyl-vinyl)-3-styryl-1H-indazole
15   6-(1-Phenyl-vinyl)-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-

indazole (16.2 mg, 0.0358 mmol) was dissolved in THF (0.6 mL) and was treated

with tetrabutylammonium fluoride (TBAF, 1M in THF, 0.6 mL). The mixture was

heated to 60 °C under argon for 4 h. The mix was cooled, neutralized with excess

saturated sodium bicarbonate and the organic material was extracted into ethyl

20   acetate and concentrated. This mix of 3 compounds (by TLC visualization) was

treated with THF-water-TFA (1:1:2, 4 mL) for 30 min. The mix was diluted with

toluene (20 mL), concentrated, neutralized with excess saturated sodium bicarbonate,

and the organic material was extracted into ethyl acetate. The organic material was

dried over sodium sulfate, decanted and concentrated. Purification by silica gel

5　chromatography (2:8 ethyl acetate-hexane) gave 6-(1-Phenyl-vinyl)-3-styryl-1*H*-

indazole (4.6 mg, 40%): R_f sm 0.62, p 0.24 (ethyl acetate-hexane 3:7); ^{1}H NMR

(300 MHz, CDCl$_3$) δ 7.99 (d, 1H, J = 8.5 Hz), 7.60-7.25 (m, 14H), 5.58 (d, 1H, J =

1.1 Hz), 5.56 (d, 1H, J = 1.1 Hz); HRMS (FAB) [m+H]/z Calc'd 323.1548, Found

323.1545.

10　　　　The starting material was prepared as follows:

(i)
6-Iodoindazole was converted to 3,6-diiodoindazole (82%) as described in

Example 1(a), step (v): ^{1}H NMR (300 MHz, CDCl$_3$) δ 10.3 (bs, 1H), 7.90 (s, 1H),

15　7.52 (dd, 1H, J = 1.2, 8.5 Hz), 7.24 (d, 1H, J = 8.5 Hz).

(ii)
3,6-Diiodoindazole (755 mg, 2.04 mmol) was added to 50% KOH (2.5 g in

2.5 mL water) at 0 °C and dichloromethane (4 mL) was added. To this mixture was

20　added tetrabutylammonium bromide (TBABr, 6.6 mg, 0.02 mmol, 0.01 equiv) and 2-

(trimethyl-silanyl)-ethoxymethyl chloride (SEM-Cl, 397 μL, 2.24 mmol, 1.10 equiv)

was added dropwise over a 3 min period. The mixture was stirred rapidly at 0 °C for

1.5 h. Water (20 mL) and dichloromethane (20 mL) were added and the organic

material was separated, dried over sodium sulfate and concentrated. Silica gel

chromatography (5% ethyl acetate in hexane; 150 mL silica) gave 2 isomeric

5   compounds (1-SEM, 763 mg, 75%; and 2-SEM, 105 mg, 10%): R_f sm 0.08, p 0.34

and 0.27 (ethyl acetate-hexane 1:9); ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.0 (s, 1H), 7.55

(d, 1H, J = 8.5 Hz), 7.24 (d, 1H, J = 8.5 Hz), 5.69 (s, 2H), 3.58 (t, 2H J = 8.2 Hz),

0.90 (t, 2H, J = 8.2 Hz), -0.1 (s, 9H).

(iii)

10
1-Bromostyrene (26 μL, 0.20 mmol, 2.0 equiv) was dissolved in THF (0.75

mL), cooled to -78 °C and was treated with *t*-BuLi (235 μL, 0.40 mmol, 1.70 M, 4.0

equiv). The mixture was allowed to warm to -42 °C for 10 min and was added to

freshly dried zinc chloride (34 mg, 0.25 mmol, 2.5 equiv). The resulting solution was

15   allowed to warm to 23 °C with stirring for 25 min. This mix was added to a mixture

of neat 3,6-Diiodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole (50 mg, 0.10

mmol, 1 equiv) and Pd(PPh$_3$)$_4$ (5 mg, 0.004 mmol, 0.04 equiv). After 10 min the

reaction was determined to be complete by TLC monitoring and was quenched with

saturated sodium bicarbonate. Organic material was extracted into ethyl acetate,

20   dried over sodium sulfate and concentrated under reduced pressure. Silica gel

chromatography (5:95 ethyl acetate-hexane) provided 3-Iodo-6-(1-phenyl-vinyl)-1-

[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole (33.1 mg, 70 %): R*f* sm 0.39, p

0.36 (ethyl acetate-hexane 1:9); ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.50 (s, 1H), 7.42 (d,

1H, J = 8.4 Hz), 7.33 (m, 5H), 7.22 (dd, 1H, J = 1.2, 8.4 Hz), 5.68 (s, 2H), 5.59 (d,

(iv)
Preparation of 6-(1-Phenyl-vinyl)-3-styryl-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1*H*-indazole: E-2-Bromostyrene (23 µL, 0.174 mmol, 2.5 equiv) was

10   dissolved in THF (1.0 mL) and was cooled to -78 °C. *t*-BuLi (205 µL, 0.348 mmol,

5.00 equiv) was added and the mixture was warmed to -42 °C for 7 min to give a

deep red mixture. The solution was added to freshly dried zinc chloride (29 mg,

0.209 mmol, 3.00 equiv) via cannula and the mix was allowed to warm to 23 °C with

stirring for 20 min. This solution was added to a neat mixture of 3-Iodo-6-(1-phenyl-

15   vinyl)-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole (33.1 mg, 0.0696 mmol,

1.0 equiv) and Pd(PPh$_3$)$_4$ (4 mg, 0.0035 mmol, 0.05 equiv) at 23 °C via cannula.

This solution was allowed to stir for 15 min and was treated with saturated sodium

bicarbonate and extracted with ethyl acetate. The organic material was dried over

sodium sulfate, decanted and concentrated. Purification by silica gel chromatography

20   using two columns (5:95 ethyl acetate-hexane; 12 mL silica: and 1:99 ethyl acetate-

benzene;12 mL silica) gave 6-(1-Phenyl-vinyl)-3-styryl-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1*H*-indazole (16.2 mg, 51%): R*f* sm 0.38, p 0.29 (ethyl acetate-

hexane 1:9); ¹H NMR (300 MHz, CDCl3) δ 7.98 (d, 1H, J = 8.4 Hz), 7.62-7.22 (m,

14H), 5.71 (s, 2H), 5.57 (s, 2H), 3.60 (t, 2H, J = 8.2 Hz), 0.90 (t, 2H, J = 8.2 Hz), -.08

(s, 9H); HRMS (FAB) [m+H]/z Calc'd 453.2362, Found 453.2354.

5   **Example 11: *N*-Methyl-*N*-(3-styryl-1*H*-indazol-6-yl)-benzene-1,3-diamine**
To *N*-methyl-*N*-{3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazol-

6-yl}-benzene-1,3-diamine (237 mg, 0.5 mmol) was added 1M TBAF in THF (10.1

mL, 10.1 mmol), followed by ethylenediamine (0.34 mL, 5.04 mmol, 10 equiv). The

10   resulting mixture was heated to 70 °C for 5 h. The reaction was then quenched with

saturated NaHCO3 (10 mL) and extracted 3x35 mL EtOAc. The pooled EtOAc

phase was washed 5 x 20 mL H2O, then brine (20 mL), dried with Na2SO4, decanted

and concentrated under reduced pressure to a foam. The crude material was purified

by silica gel chromatography (9:1 dichloromethane/ethyl acetate) to give *N*-methyl-

15   *N*-(3-styryl-1*H*-indazol-6-yl)-benzene-1,3-diamine as a foam (120 mg, 70% yield).

Methyl-phenyl-{3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-indazol-

6-yl}-amine was converted to methyl-phenyl-(3-styryl-1*H*-indazol-6-yl)-amine as

described in Example 11. MS (ESI) [M+H]/z Calc'd 326, found 326.

The starting material was made as follows:

(i)
To a solution of 3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazol-

5   6-ylamine (1.58 g, 4 mmol) in AcOH (14 mL), water (3 mL) and concentrated HCl

(1.67 mL) cooled to 2 °C was added a solution of NaNO2 (304 mg, 4.4 mmol) in

water (0.5 mL) over 5 min. The resulting dark red solution was stirred at 2 °C for 0.5

h, then a solution of KI (797 mg, 4.8 mmol) and I2 (610 mg, 2.4 mmol) in water (1

mL) was added drop-wise so as to keep the internal temperature below 5 °C. After 2 h

10 at 2 °C the reaction was allowed to stir at 23 °C for 17 h. The reaction was quenched

with 3 N NaOH (aq), diluted with EtOAc (50 mL) and H2O (15 mL), the phases were

separated and the aqueous was extracted 2 x 15 mL EtOAc. The pooled organic

phase was washed 3 x 20 mL 5% NaHSO3, brine (15 mL), dried with Na2SO4,

decanted and concentrated under reduced pressure. The crude reaction was purified

15 by silica gel chromatography (eluting with 1:1 hexane:EtOAc) to give 6-iodo-3-

styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole as a white solid (1.3 g,

68% yield). ^{1}H NMR (300 MHz, CDCl3) δ 8.03 (s, 1H), 7.79 (d, 1H, J = 9.0 Hz),

benzene-1,3-diamine

[3-(2-Benzo[1,3]dioxol-5-yl-vinyl)-1*H*-indazol-6-yl]-methyl-(3-nitro-phenyl)-

amine was converted to *N*-[3-(2-benzo[1,3]dioxol-5-yl-vinyl)-1*H*-indazol-6-yl]-*N*-

15   methyl-benzene-1,3-diamine as described in Example 11, step (iv). LCMS (ESI)

[M+H]/z Calc'd 385, found 385. Anal. Calc'd: C, 71.86; H, 5.24; N, 14.57. Found:

C, 70.99; H, 5.60; N, 13.80.

The starting material was prepared as follows:

(i)
To a mixture of 6-nitro-3-iodo-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole (4.2 g, 10 mmol), boronic acid (3.46 g, 15 mmol), and Pd(PPh3)4 (0.58 g,

5   0.5 mmol) at 23 °C under an atmosphere of argon was added 1,4-dioxane (38 mL) and 2N NaOH (aq) (12.5 mL, 25 mmol). The resulting mixture was heated to 90 °C. After 2 h the reaction was diluted with EtOAc (100 mL) and water (70 mL), the phases were separated and the organic was extracted 2 X 100 mL EtOAc. The pooled organic phase was washed with brine (20 mL) then dried with Na_2SO_4, filtered and

10   concentrated under reduced pressure. The crude mixture was purified by silica gel chromatography (eluting with 9:1 hexane:EtOAc) to give 3-(2-benzo[1,3]dioxol-5-yl-vinyl)-6-nitro-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole as a yellow solid (4.15 g, 94% yield). methylamino]-3-E-[(3,4-methylenedioxyphenyl)ethenyl]-1*H*-indazole
Example 16(f) was prepared in a similar manner to that described for Example 16(a), except that 3-*tert*-butyl-4-hydroxy-benzoic acid, HATU, and TEA were used instead of benzoyl chloride. ^{1}H NMR (300 MHz, CD$_3$OD) δ: 7.90 (d, 1H, J = 8.91 Hz), 7.83 (d, 1H, J = 2.29 Hz), 7.63 (dd, 1H, J = 8.36 Hz, J = 2.31 Hz), 7.54 (t, 1H, J = 1.97 Hz), 7.25-7.43 (m, 4H), 7.14-7.20 (m, 2H), 7.06 (dd, 1H, J = 8.11 Hz, J = 1.55 Hz), 6.96 (dd, 1H, J = 8.93 Hz, J = 1.97 Hz), 6.90 (m, 1H), 6.82 (t, 2H, J = 8.18 Hz), 6.0 (s, 2H), 3.41 (s, 3H), 1.42 (s, 9H).

Example 17: Phenyl-(3-styryl-1H-indazol-6-yl)-methanone
Phenyl-{3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-indazol-6-yl}-methanone was converted to phenyl-(3-styryl-1H-indazol-6-yl)-methanone as described in Example 11 (30 mg, 78%). MS (ESI) [M+H]/z Calc'd 325, found 325. Anal. Calc'd: C, 81.46; H, 4.97; N, 8.46. Found: C, 80.36; H, 5.16; N, 8.51.

The starting material was prepared as follows:
(i)

To a solution of 6-iodo-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-

indazole, prepared in Example 14, step (i), (143 mg, 0.3 mmol) in THF (1 mL)

cooled to -78 °C under an atmosphere of argon was added *n*-BuLi (0.2 mL, 0.315

5   mmol) dropwise. The resulting mixture was stirred at -78 °C for 30 min, then a

solution of benzaldehyde (0.035 mL, 0.33 mmol) in THF (0.5 mL) was added rapidly

via a cannula. After 0.5 h the reaction was quenched with saturated NH4Cl (aq) and

diluted with EtOAc (10 mL) and H2O (3 mL). The phases were separated and the

aqueous was extracted 2x10 mL EtOAc. The pooled EtOAc was washed with brine

10   (5 mL), dried with Na2SO4, decanted and concentrated under reduced pressure. The

crude mixture was purified by silica gel chromatography (eluting with hexane:EtOAc

4:1) to give phenyl-{3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazol-6-

yl}-methanol (68 mg, 50% yield). R*f* sm = 0.72; R*f* p = 0.39 (7:3 hexane:EtOAc);

FTIR (thin film) 3368, 2952, 2893, 1621, 1478, 1449, 1374, 1307, 1249, 1216, 1078,

15   960, 859, 835 cm⁻¹. MS (ESI) [M+H]/z Calc'd 457, found 457.

(ii)
To a solution of phenyl-{3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-

indazol-6-yl}-methanol (68 mg, 0.15 mmol) in dichloromethane (3 mL) at 23 °C

under an atmosphere of argon was added periodinane (Dess-Martin reagent) (190 mg,

0.45 mmol). The resulting mixture was stirred at 23 °C for 1 hour. The solution was

5   then diluted with hexane (3 mL) then filtered through Celite and concentrated under

reduced pressure to a solid. The crude mixture was purified by silica gel

chromatography (eluting with hexane:EtOAc 9:1) to give phenyl-{3-styryl-1-[2-

(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazol-6-yl}-methanone (54 mg, 79% yield).

R*f* sm = 0.41, R*f* p = 0.63 (7:3 hexane:EtOAc); FTIR (thin film) 3059, 2952, 2894,

indazole

5
Example 19(o) was prepared in a similar manner to Example 19(d) except 2-

chloro-isonicotinic acid was used instead of 5-methyl-thiazole-2-carboxylic acid. MS

(ESI+) [M+H]/z Calc'd 479, found 479.

Example 19(p): 6-[3-(2-methylamino-2-phenylacetamido)benzoyl]-3-E-styryl-1*H*-
10   **indazole**

To a solution of 6-[3-(2-(N-*t*-butoxycarbonyl-N-methylamino)-2-phenyl-

acetamido)benzoyl]-3-E-styryl-1*H*-indazole (115 mg, 0.2 mmol) in CH$_2$Cl$_2$ (2 ml)

cooled to 0 °C was added TFA (2 ml). After 40 min. the reaction mixture was

15   quenched with saturated NaHCO$_3$ (aq), then extracted with CH$_2$Cl$_2$ (2 x 10 ml). The

Organics were washed with brine, dried with Na$_2$SO$_4$, decanted and concentrated.

Purification by silica gel chromatography (1:10 methanol-dichloromethane) gave 6-

[3-(2-methylamino-2-phenylacetamido)benzoyl]-3-E-styryl-1*H*-indazole (38 mg,

39%). MS (ESI+) [M+H]/z Calc'd 487, found 487. Anal. Calc'd: C, 76.52; H, 5.39;

N, 11.51. Found: C, 74.99; H, 5.76; N, 10.89.

The starting material was prepared as described below:

5   (i)   6-[3-(2-(N-*t*-butoxycarbonyl-N-methylamino)-2-phenyl-
acetamido)benzoyl]-3-E-styryl-1*H*-indazole
6-[3-(2-(N-*t*-butoxycarbonyl-N-methylamino)-2-phenyl-acetamido)benzoyl]-3-E-

styryl-1*H*-indazole was prepared in a similar manner to Example 19(d) except that (t-

butoxycarbonyl-methyl-amino)-phenyl-acetic acid was used instead of 5-methyl-

10   thiazole-2-carboxylic acid. MS (ESI+) [M+H]/z Calc'd 587, found 587.

Example 20(a): 6-(3-Acetamido-phenylsulfanyl)-3-styryl-1*H*-indazole
6-(3-Acetamido-phenylsulfanyl)-3-styryl-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1*H*-indazole was converted to 6-(3-acetamido-phenylsulfanyl)-3-

15   styryl-1*H*-indazole as described in Example 11 (30 mg, 81%): R$_f$ sm 0.65, p 0.35

(10% methanol in dichloromethane); ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.81 (d, 1H, J =

8.5 Hz), 7.59 (bs, 1H), 7.48-7.0 (m, 13H), 1.98 (s, 3H); HRMS (FAB) [M+Na]/z

Calc'd 408.1147, found 408.1156.

The starting material was prepared as follows:

(i)
To the 9-BBN adduct of 3-phthalamido-thiophenol (1.4 equiv), which was

prepared *in situ* as described below, was added 3,6-Diiodo-1-[2-(trimethyl-silanyl)-

5   ethoxymethyl]-1*H*-indazole (250 mg, 0.5 mmol), Pd(dppf)Cl₂ (87 mg, 0.2 equiv) and

potassium phosphate (339 mg, 1.6 mmol, 3.00 equiv) in DMF (3.0 mL). The reaction

mixture was heated to 90 °C for 9 h. The mixture was cooled and partitioned

between ethyl acetate and saturated sodium bicarbonate. The organic material was

dried over sodium sulfate, decanted and concentrated. Purification by silica gel

10 chromatography (2:8 ethyl acetate-hexane) gave 6-(3-phthalamido-phenylsulfanyl)-3-

iodo-1*H*-indazole as an oil (159 mg, 50%): ¹H NMR (300 MHz, CDCl₃) δ 7.93 (m,

2H), 7.79 (m, 2H), 7.62 (s, 1H), 7.5-7.3 (m, 5H), 7.22 (d, 1H), 5.68 (s, 2H), 3.55 (t,

2H, J = 8.2 Hz), 0.87 (t, 2H, J = 8.2 Hz), -.06 (s, 9H); HRMS (FAB) [M+Cs]/z Calc'd

759.9563, found 759.9571.

15   The boron reagent was prepared as follows: In a 10 mL Schlenk flask 3-

phthalamido-thiophenol was dried under high vacuum. To this was added a solution

of 9-BBN (0.5 M in THF, 1.6 mL, 1.0 equiv). The mixture was heated to 55 °C for 2

h. The volatile material was removed under a stream of argon at 70 °C for 1.5 h. The

residue was used without further manipulation.

20   (ii)
6-(3-Phthalamido-phenylsulfanyl)-3-iodo-1*H*-indazole was converted to 6-(3-

phthalamido-phenylsulfanyl)-3-styryl-1*H*-indazole as described in Example 11, step

(iii). ¹H NMR (300 MHz, CDCl₃) δ 7.93 (m, 3H), 7.78 (m 2H), 7.7 (s, 1H), 7.58 (m,

5   2H), 7.47-7.26 (m, 10H), 5.71 (s, 2H), 3.59 (t, 2H, J = 8.2 Hz), 0.89 (t, 2H, J = 8.2

Hz), -0.06 (s, 9H); HRMS (FAB) [M+Cs]/z Calc'd 736.1066, found 736.1058.

(iii)
To a solution of 6-(3-phthalamidophenylsulfanyl)-3-styryl-1*H*-indazole (121

10   mg, 0.2 mmol) in ethanol (3.5 mL) was added hydrazine (63 μL, 2.0 mmol, 10

equiv). The reaction mixture was allowed to stir at 23 °C for 45 min and was diluted

with saturated sodium bicarbonate and ethyl acetate. The organic material was dried

over sodium sulfate, decanted and concentrated. Purification by silica gel

chromatography (3:7 ethyl acetate-hexane) gave 6-(3-aminophenylsulfanyl)-3-styryl-

15   1*H*-indazole as an oil (79 mg, 90%): ¹H NMR (300 MHz, CDCl₃) δ 7.92 (d, 1H, J =

8.5 Hz), 7.57 (m, 3H), 7.49 (d, 1H, J = 16.8 Hz), 7.4-7.25 (m, 4H), 7.23 (dd, 1H, J =

1.5, 8.5 Hz), 7.11 (t, 1H, J = 7.9 Hz), 6.79 (m, 1H), 6.70 (t, 1H, J = 1.9 Hz), 6.59 (m,

1H), 5.66 (s, 2H), 3.60 (bs, 2H), 3.59 (t, 2H, J = 8.2 Hz), 0.90 (t, 2H, J = 8.2 Hz), -

0.05 (s, 9H); HRMS (FAB) [M+H]/z Calc'd 474.2035, found 474.2019.

(iv)
To a solution of 6-(3-aminophenylsulfanyl)-3-styryl-1H-indazole (43.7 mg,

0.10 mmol) in dichloromethane (0.5 mL) was added pyridine (81 µL, 1.0 mmol, 10

5   equiv), and acetic anhydride (47 µL, 0.5 mmol, 5 equiv). The mixture was allowed to

stir for 10 min at 23 °C. The mixture was diluted with water and the product was

extracted with 30% hexane in ethyl acetate. The organic material was washed with

5% citric acid and saturated sodium bicarbonate. The organic material was dried

over sodium sulfate, decanted and concentrated. Purification by silica gel

10   chromatography (3:7 ethyl acetate-hexane) gave 6-(3-acetamido-phenylsulfanyl)-3-

styryl-1H-indazole as an oil (50 mg, 97%): R$_f$ sm 0.33, Rf p 0.18 (ethyl acetate-

hexane 3:7); ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.94 (d, 1H), 7.65-7.1 (m, 13H), 5.70 (s,

2H), 3.62 (t, 2H, J = 8.2 Hz), 2.18 (s, 3H), 0.93 (t, 2H, J = 8.2 Hz), -0.05 (s, 9H).

HRMS (FAB) [M+Cs]/z Calc'd 648.1117, found 648.1098.

15   **Example 20(b): 6-(3-(Benzoylamido)-phenylsulfanyl)-3-styryl-1H-indazole**
The title compound was prepared like Example 20(a),, except that benzoyl

chloride was used instead of acetic anhydride in step (iv). ^{1}H NMR (300 MHz,

CDCl$_3$) δ 8.03 (s, 1H), 7.73 (d, 1H, J = 8.5 Hz), 7.63 (m, 2H). 7.47 (m, 1H), 7.42 (t,

1H, J = 1.9 Hz), 7.37 (m, 3H), 7.31 (m, 1H), 7.28-6.98 (m, 9H); HRMS (FAB)

[M+H]/z Calc'd 448.1484, found 448.1490.

Example 21: 6-(1-(3-Aminophenyl)-vinyl)-3-styryl-1H-indazole
5   6-(1-(3-Aminophenyl)-vinyl)-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-

1H-indazole was converted to the title compound as described for Example 11 (85

mg, 85%): R_f sm 0.72, p 0.37 (ethyl acetate-hexane 1:1); FTIR (thin film) 3385,

3169, 2953, 1621, 1581, 1489, 1447, 1349, 1251, 1165, 1071, 959, 906, 870, 817 cm⁻

1; 1H NMR (300 MHz, CDCl₃) δ 7.98 (d, 1H, J = 8.5 Hz), 7.60 (m, 2H), 7.51 (s, 1H),

10   7.48 (s, 1H), 7.40 (m, 3H), 7.29 (m, 2H), 7.15 (m, 1H), 6.78 (m, 1H), 6.68 (m, 2H),

5.50 (s, 2H), 3.65 (bs, 2H); MS (ES) [M+H]/z Calc'd 338, found 338; MS (ES) [M-

H]/z Calc'd 336, found 336.

The starting material was prepared as follows:
(i)

15

To a solution of 6-iodo-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-

indazole, prepared in Example 14, step (i), (330 mg, 0.693 mmol) in THF (3.0 mL)

at -78 °C was added n-butyllithium (0.56 mL, 1.5 M, 1.2 equiv). After 20 min, this

solution was then added to anhydrous zinc chloride (170 mg) and the mixture was

20   warmed to 23 °C and stirred for 15 min. To this mixture was added 1-(3-nitro-

phenyl)vinyltriflate (146 µL, 1.05 equiv) and Pd(PPh₃)₄ (40 mg, 0.05 equiv). This

mixture was stirred for 30 min, was partitioned between ethyl acetate and saturated

sodium bicarbonate and the organic layer was separated. The organic material was

dried over sodium sulfate, decanted and concentrated under reduced pressure.

5   Purification by silica gel chromatography (1:9 ethyl acetate-hexane) then a second

column (1% ethyl acetate/benzene) gave 6-(1-(3-nitrophenyl)-vinyl)-3-styryl-1-[2-

(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole as an oil (180 mg, 52%): FTIR (thin

film) 2951, 1616, 1530, 1477, 1448, 1348, 1305, 1248, 1217, 1077, 961, 913, 859

cm^{-1}; ^{1}H NMR (300 MHz, CDCl₃) δ 8.26 (t, 1H, J = 1.9 Hz), 8.21 (m, 1H), 8.00 (d,

10   1H, J = 8.5 Hz), 7.69 (dt, 1H, J = 1.4, 7.8), 7.62-7.28 (m, 9H), 7.19 (dd, 1H, J = 1.4,

8.4 Hz), 5.72 (s, 3H), 5.69 (s, 1H), 3.60 (t, 2H, J = 8.2 Hz), 0.89 (t, 2H, J = 8.2 Hz), -

5   **Example 24(a): 4-[3-(1-*H*-Benzoimidazol-2-yl)-1-*H*-indazol-6-yl]-2-methoxy-**
5-methyl-phenol

6-{5-Methoxy-2-methyl-4-[2-(trimethyl-silanyl)-ethoxymethoxy]-

phenyl}-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-

10   ethoxymethyl]-1-*H*-benzamidazol-2-yl}-1-*H*-indazole (326 mg, 0.43 mmol) was

stirred in a solution of TBAF (4.5 mL of 1 M in THF, which was concentrated *in*

vacuo to 2.5 mL) and ethylenediamine (0.6 mL, 8.9 mmol) at reflux for 40 h. The

reaction was diluted with ethyl acetate/THF (40 mL/5 mL) and washed with H$_2$O

(20 mL) and brine (20 mL). Organics were dried (MgSO$_4$) and concentrated *in*

15   *vacuo*. Purification by silica gel chromatography (60% THF/hexanes) and then

precipitation from chloroform gave 108 mg (68%) of 4-[3-(1-*H*-benzoimidazol-2-

yl)-1-*H*-indazol-6-yl]-2-methoxy-5-methyl-phenol as a white solid. ^{1}H NMR (300

MHz, DMSO-d_6) δ 13.62 (s, 1 H), 13.05 (br s, 1 H), 9.01 (s, 1 H), 8.50 (d, 1 H, J

= 8.4 Hz), 7.62 (br s, 2 H), 7.49 (s, 1 H), 7.28-7.20 (m, 3 H), 6.85 (s, 1 H), 6.74 (s,

1 H), 3.77 (s, 3 H), 2.15 (s, 3 H). Anal. ($C_{22}H_{18}N_4O_2$· 1.3 H_2O) C, H, N. Calculated:

C, 67.10; H, 5.27; N, 14.23. Found: C, 67.30; H, 5.27; N, 14.11.

The starting materials were prepared as follows:

(i)
Preparation of 2-iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-

benzoimidazole. A solution of 1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-

benzoimidazole (5.029 g, 20.25 mmol) (see Witten et al., *J. Org. Chem.*, 51,

1891-1894 (1986)) in THF (50 mL) was cooled to -78 °C and added dropwise

over 12 min via cannula to a flask containing n-butyllithium (2.5 M in hexanes,

12.2 mL) in THF (30 mL) at -78 °C under argon. After stirring for 25 min at -78

°C, the flask was warmed to 0 °C for 10 min, then cooled again to -78 °C. This

solution was then added via cannula to a second flask containing iodine (25.7 g,

101 mmol) in THF (50 mL) at -78 °C. Once the addition was complete (~5 min),

the cooling bath was removed, and stirring was continued for 30 min. The

reaction mixture was partitioned between ethyl acetate (500 mL) and water (100

mL). The organic layer was washed with saturated aqueous sodium metabisulfite

(2 x 100 mL) to remove the dark iodine color, dried ($MgSO_4$), and concentrated *in*

vacuo. Purification by flash chromatography (10% to 50% ethyl acetate/hexanes)

yielded 4.79 g (63%) of pure 2-iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-

benzoimidazole as a yellow solid. ^{1}H NMR (300 MHz, $CDCl_3$) δ 7.76-7.72 (m, 1

H), 7.54-7.51 (m, 1 H), 7.29-7.25 (m, 2 H), 5.54 (s, 2 H), 3.59 (t, 2 H, J = 8.1 Hz),

0.92 (t, 2 H, J = 8.1 Hz), -0.03 (s, 9 H). Anal. ($C_{13}H_{19}IN_2OS$) C, H. Calculated:

C, 41.71; H, 5.12; I, 33.90; N, 7.48. Found: C, 41.90; H, 5.09; I, 34.00; N, 7.37.

(ii)
5   Preparation of 6-nitro-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-(trimethyl-

stannanyl)-1-H-indazole: 3-Iodo-6-nitro-1-[2-(trimethyl-silanyl)-ethoxymethyl]-

1-H-indazole (10.0 g, 23.9 mmol) and hexamethylditin (10.0 g, 30.5 mmol) were

combined with dry toluene (45 mL) in a flask purged with argon.

Tetrakis(triphenylphosphine)-palladium(0) (300 mg, 0.26 mmol) was added, and

10   the reaction stirred at reflux under argon for 2.5 h. The reaction was cooled to 23

°C and diluted with ether (60 mL). Organics were washed with 0.1N HCl (20

mL) and brine (20 mL), dried (MgSO$_4$), and concentrated. Purification by silica

gel chromatography (3% to 8% ether/hexanes) gave 7.70 g (71%) of 6-nitro-1-[2-

(trimethyl-silanyl)-ethoxymethyl]-3-(trimethyl-stannanyl)-1-H-indazole as a

15   faintly yellow solid. ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.53 (d, 1 H, J = 1.8 Hz),

8.03 (dd, 1 H, J = 8.7, 1.8 Hz), 7.81 (d, 1 H, J = 8.7 Hz), 5.84 (s, 2 H), 3.58 (t, 2

H, J = 8.1 Hz), 0.90 (t, 2 H, J = 8.1 Hz), 0.50 (t, 9 H, J = 28.2 Hz), -0.05 (s, 9 H).

Anal. ($C_{16}H_{27}N_3O_3SiSn$) C, H, N. Calculated: C, 42.13; H, 5.97; N, 9.21. Found:

C, 42.39; H, 6.01; N, 9.26.
20   (iii)

124

Preparation of 6-nitro-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-

(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole: 6-

Nitro-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-(trimethyl-stannanyl)-1-H-

5   indazole (7.50 g, 16.4 mmol), 3-iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-

benzimidazole (6.50 g, 17.4 mmol), and copper(I) iodide (313 mg, 1.64 mmol)

were combined with dry THF (150 mL) in a flask purged with argon.

Tetrakis(triphenylphosphine)palladium(0) was added, and the reaction stirred at

reflux under argon for 23 h. The reaction was cooled and adsorbed directly onto

10   silica gel (~ 16 g). Purification by silica gel chromatography (4% to 15% ethyl

acetate/hexanes) gave 7.28 g (82%) of 6-nitro-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-

yl}-1-*H*-indazole as a light yellow solid. ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.91 (d,

1 H, J = 9.0 Hz), 8.59 (d, 1 H, J = 1.8 Hz), 8.22 (dd, 1 H, J = 8.7, 1.8 Hz), 7.92-

15   7.89 (m, 1 H), 7.66-7.62 (m, 1 H), 7.40-7.36 (m, 2 H), 6.24 (s, 2 H), 5.90 (s, 2 H),

3.68-3.59 (m, 4 H), 0.94 (t, 2 H, J = 8.1 Hz), 0.86 (t, 2 H, J = 8.1 Hz), -0.04 (s, 9

H), -0.15 (s, 9 H). Anal. (C$_{26}$H$_{37}$N$_5$O$_4$Si$_2$) C, H, N. Calculated: C, 57.85; H, 6.91;

N, 12.97. Found: C, 57.60; H, 6.81; N, 12.82.

(iv)
Preparation of 6-Amino-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole:

Tin(II) chloride (12.0 g, 63.3 mmol) was added to a solution of 6-nitro-1-[2-

5   (trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole (7.18 g, 13.3 mmol) in DMF/H_2O (160 mL/10 mL), and the reaction stirred at 50 °C for 2.5 h. The reaction was cooled to 0 °C, and saturated sodium bicarbonate was added slowly, with mixing, until all frothing from quenching had subsided. The material was concentrated *in vacuo*

10   and taken up in ether (100 mL). Insoluble material was removed by filtration and rinsed with ether (50 mL). The filtrate was washed with brine (50 mL), dried (Na_2SO_4), and concentrated *in vacuo*. Purification by silica gel chromatography (25% ethyl acetate/hexane) gave 6.05 g (89%) of 6-amino-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-

15   benzoimidazol-2-yl}-1-*H*-indazole as a faintly yellow waxy solid. ^{1}H NMR (300 MHz, $CDCl_3$) δ 8.40 (d, 1 H, J = 9.0 Hz), 7.89-7.86 (m, 1 H), 7.63-7.60 (m, 1 H), 7.35-7.31 (m, 2 H), 6.78 (dd, 1 H, J = 8.7, 1.8 Hz), 6.75 (s, 1 H), 6.25 (s, 2 H), 5.69 (s, 2 H), 3.93 (br s, 2 H), 3.65-3.55 (m, 4 H), 0.93 (t, 2 H, J = 8.1 Hz), 0.85 (t, 2 H, J = 8.1 Hz), -0.04 (s, 9 H), -0.15 (s, 9 H). Anal. ($C_{26}H_{39}N_5O_2Si_2$) C, H, N.

20   Calculated: C, 61.26; H, 7.71; N, 13.74. Found: C, 61.18; H, 7.65; N, 13.82.

(v)
Preparation of 6-iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-

(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole: A

5   solution of 6-amino-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-

silanyl)-ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole (500 mg, 0.98

mmol) in acetic acid (1.5 mL) was diluted with H_2O (1.0 mL) and stirred at 0 °C.

Concentrated HCl (250 μL, ~ 3 mmol) in H_2O (250 μL) was added. Sodium

nitrate (90 mg, 1.3 mmol) in H_2O (300 μL) was added, and the reaction stirred for

10   8 min. Iodine (10 mg) and a solution of potassium iodide (250 mg, 1.3 mmol) in

H_2O (250 μL) were added, and the frothing reaction stirred for 30 min at 23 °C.

The reaction was diluted with H_2O (25 mL) and extracted with ethyl acetate (2 x

20 mL). Organics were washed with saturated sodium metabisulfite solution (10

mL) and brine (10 mL), dried (Na_2SO_4), and concentrated *in vacuo*. Purification

15   by silica gel chromatography (8% ethyl acetate/hexanes) gave 316 mg (52%) of

6-iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole as a faintly yellow oil,

which slowly crystallized to a white solid. ^{1}H NMR (300 MHz, $CDCl_3$) δ 8.45 (d,

1 H, J = 9.0 Hz), 8.05 (s, 1 H), 7.91-7.88 (m, 1 H), 7.67-7.62 (m, 2 H), 7.38-7.34

20   (m, 2 H), 6.24 (s, 2 H), 5.77 (s, 2 H), 3.65-3.57 (m, 4 H), 0.93 (t, 2 H, J = 8.1 Hz),

0.85 (t, 2 H, J = 8.1 Hz), -0.04 (s, 9 H), -0.15 (s, 9 H). Anal. ($C_{26}H_{37}IN_4O_2Si_2$) C,

H, N. Calculated: C, 50.31; H, 6.01; N, 9.03. Found: C, 50.55; H, 6.08; N,

9.00.

(vi)
Preparation of [2-(4-bromo-2-methoxy-5-methyl-phenoxymethoxy)-

ethyl]-trimethyl-silane: 4-Bromo-2-methoxy-5-methyl-phenol (see Chien-Hsun et

al., *Syn. Lett.*, 12, 1351-1352 (1997)) was stirred in dry CH_2Cl_2 (100 mL) at 23 °C.

DIEA (6.05 mL, 34.6 mmol), and then 2-(trimethylsilyl)ethoxymethyl chloride

(5.6 mL, 31.7 mmol) were added. After stirring for 1 h, the solution was washed

with H_2O, 0.1 N HCl, H_2O, saturated $NaHCO_3$, and brine (25 mL each). Organics

were dried (Na_2SO_4) and concentrated *in vacuo*. Purification by silica gel

chromatography (6% ethyl acetate/hexanes) gave 9.06 g (91%) of [2-(4-bromo-2-

methoxy-5-methyl-phenoxymethoxy)-ethyl]-trimethyl-silane as a clear oil. [1]H

NMR (300 MHz, $CDCl_3$) δ 7.06 (s, 1 H), 7.02 (s, 1 H), 5.24 (s, 2 H), 3.84 (s, 3

H), 3.79 (t, 2 H, J = 8.4 Hz), 2.31 (s, 3 H), 0.96 (t, 2 H, J = 8.4 Hz), 0.01 (s, 9 H).

(vii)
Preparation of 5-methoxy-2-methyl-4-[2-(trimethyl-silanyl)-

ethoxymethoxy]-phenyl-boronic acid: [2-(4-Bromo-2-methoxy-5-methyl-

phenoxymethoxy)-ethyl]-trimethyl-silane (2.6 g, 7.5 mmol) was stirred in dry

THF (10 mL) at -78 °C under argon. n-Butyllithium (3.75 mL, 2.5 M in hexanes,

9.36 mmol) was added dropwise, and the reaction stirred for 30 min before it was

transferred via cannula to a flask of trimethyl borate (8.4 mL, 75 mmol) in THF

5   (15 mL), which was also stirring at -78 °C under argon. After addition was

complete, the reaction stirred 30 min at -78 °C and then 30 min while warming to

0 °C. It was then quenched with H_2O (20 mL), acidified with 0.1 N HCl, and

extracted with ethyl acetate (2 x 25 mL). Organics were washed with brine (20

mL), dried (Na_2SO_4), and concentrated *in vacuo*. Purification by silica gel

10   chromatography (20% to 50% ethyl acetate/hexanes) gave 1.11 g (47%) of 5-

methoxy-2-methyl-4-[2-(trimethyl-silanyl)-ethoxymethoxy]-phenyl-boronic acid

as a white solid. 'H NMR (300 MHz, $CDCl_3$) δ 7.78 (s, 1 H), 7.10 (s, 1 H), 5.36

(s, 2 H), 3.93 (s, 3 H), 3.83 (t, 2 H, J = 8.4 Hz), 2.79 (s, 3 H), 0.98 (t, 2 H, J = 8.4

Hz), 0.01 (s, 9 H). Anal. ($C_{14}H_{25}BO_5Si$ - H_2O) C, H. Calculated: C, 57.15; H,

15   7.88. Found: C, 56.89; H, 7.87.

(viii)
Preparation of 6-{5-methoxy-2-methyl-4-[2-(trimethyl-silanyl)-

ethoxymethoxy]-phenyl}-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-

(trimethyl-silanyl)-ethoxymethyl]-1-*H*-benzamidazol-2-yl}-1-*H*-indazole. 6-

Iodo-1-[2-(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1-*H*-benzoimidazol-2-yl}-1-*H*-indazole (350 mg, 0.56 mmol), 5-

methoxy-2-methyl-4-[2-(trimethyl-silanyl)-ethoxymethoxy]-phenyl-boronic acid

5   (211 mg, 0.68 mmol), and sodium carbonate (72 mg, 0.68 mmol) were stirred in a

mixture of benzene (5 mL), H_2O (330 µL), and methanol (1 mL) in a flask purged

with argon. Tetrakis(triphenylphosphine)palladium(0) was added, and the

reaction stirred at reflux under argon for 16 h. After cooling to 23 °C, the

reaction was diluted with ether (20 mL), washed with H_2O (10 mL) and brine (10

10   mL), dried (Na_2SO_4), and concentrated *in vacuo*. Purification by silica gel

chromatography (15% ethyl acetate/hexanes) gave 382 mg (89%) of 6-{5-

methoxy-2-methyl-4-[2-(trimethyl-silanyl)-ethoxymethoxy]-phenyl}-1-[2-

(trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1-*H*-

benzamidazol-2-yl}-1-*H*-indazole as a white solid. ^{1}H NMR (300 MHz, $CDCl_3$) δ

10   **Example 24(e): 3-1*H*-Benzoimidazol-2-yl-6-(2-ethyl-4-hydroxyphenyl)- 1*H*-**

indazole
Example 24 (e) was prepared in a similar manner to that described for

Example 24(a), except that 4-bromo-3-ethyl-phenol, prepared in 80% yield according

15   to the procedure described by Carreno et. al., *Syn. Lett.*, 11, 1241-42 (1997) for the

synthesis of 4-bromo-3-methyl-phenol, was used instead of 4-bromo-2-methoxy-5-

135

methyl-phenol in step (vi). ^{1}H NMR (300 MHz, DMSO-d_6) δ 13.66 (s, 1H), 13.02 (s, 1H), 9.43 (s, 1H), 8.49 (d, 1H, J = 8.4Hz), 7.72 (d, 1H, J = 6.9Hz), 7.53 (d, 1H, J = 6.9Hz), 7.44 (s, 1H), 7.18-7.25 (m, 3H), 7.06 (d, 1H, J = 8.1Hz), 6.75 (d, 1H, J = 2.1Hz), 6.66 (dd, 1H, J = 8.1, 2.1Hz), 2.50 (q, 2H, J = 7.5Hz), 1.04 (t, 3H, J = 7.5Hz).

5   MS (ES) [m+H]/z calc'd 355, found 355; [m-H]/z calc'd 353, found 353.

Example 24(f): 3-1H-Benzoimidazol-2-yl-6-(2, 4-dihydroxyphenyl)- 1H-indazole
6-(2-methoxy-4-hydroxyphenyl)-3-1H-benzoimidazol-2-yl-1H-indazole,

prepared in example 24(d), (46 mg, 0.13 mmol) was heated in pyridinium chloride

10   (0.5 g) at 180 °C for 2 h. The reaction was allowed to cool, and was quenched with

sat. NaHCO$_3$ (15 mL) and extracted with EtOAc (2 x 20 mL). Organics were dried

(Na$_2$SO$_4$) and concentrated *in vacuo*. Purification by silica gel chromatography (60%

THF/hexanes) gave 26 mg (59%) of the title compound as a white solid. ^{1}H NMR

(300 MHz, DMSO-d_6) δ 13.49 (s, 1H), 12.94 (s, 1H), 9.49 (s, 1H), 9.39 (s, 1H), 8.43

15   (d, 1H, J = 8.4Hz), 7.71-7.74 (m, 2H), 7.50 (d, 1H, J = 6.9Hz), 7.43 (dd, 1H, J = 8.4, 1.2Hz), 7.16-7.23 (m, 3H), 6.45 (d, 1H, J = 2.1Hz), 6.35 (dd, 1H, J = 8.4, 2.1Hz).

MS (ES) [m+H]/z calc'd 343, found 343; [m-H]/z calc'd 341, found 341.

Example 24(g): 3-1H-Benzoimidazol-2-yl-6-(2-phenoxy-4-hydroxyphenyl)- 1H-indazole
Example 24 (g) was prepared in a similar manner to that described for

Example 24(c), except that 3-phenoxy-phenol was used instead of 2-chloro-5-methyl-

phenol in step (i). ^{1}H NMR (300 MHz, DMSO-d_6) δ 13.54 (s, 1H), 12.95 (s, 1H),

5   9.78 (s, 1H), 8.43 (d, 1H, J = 8.4Hz), 7.67-7.72 (m, 2H), 7.49 (dd, 1H, J = 6.3,

2.1Hz), 7.43 (d, 2H, J = 8.4Hz),7.33 (t, 2H, J = 7.5Hz), 7.17-7.22 (m, 2H), 6.96-7.07

(m, 3H), 6.72 (dd, 1H, J = 8.4, 2.1Hz), 6.40 (d, 1H, J = 2.1Hz). MS (ES) [m+H]/z

calc'd 419, found 419; [m-H]/z calc'd 417, found 417.

Example 24(h): 3-1H-Benzoimidazol-2-yl-6-(2-(2-methoxyethyl)-4-

10   **hydroxyphenyl)- 1H-indazole**
Example 24 (h) was prepared in a similar manner to that described for

Example 24(a), except that {2-[4-bromo-3-(2-methoxy-ethyl)-phenoxymethoxy]-

ethyl}-trimethyl-silane, prepared as described below, was used instead of [2-(4-

15   bromo-2-methoxy-5-methyl-phenoxymethoxy)-ethyl]-trimethylsilane in step (vii). ^{1}H

137

NMR (300 MHz, DMSO-d_6) δ 13.60 (s, 1H), 13.01 (s, 1H), 9.44 (s, 1H), 8.49 (d, 1H,

J = 8.4Hz), 7.73 (br s, 1H), 7.51 (br s, 1H), 7.46 (s, 1H), 7.21 (app d, 3H, J = 8.1Hz),

7.09 (d, 1H, J = 8.1Hz), 6.78 (d, 1H, J = 2.4Hz), 6.70 (dd, 1H, J = 8.1, 2.4Hz), 3.40

5   385, found 385; [m-H]/z calc'd 383, found 383.

The starting material was prepared as follows:

(i)
4-Bromo-3-(2-hydroxy-ethyl)-phenol was prepared in 88% yield by the

10   substitution of 3-(2-hydroxy-ethyl)-phenol in the procedure described in Example

24(c), step (i). ¹H NMR (300 MHz, CDCl₃) δ 9.56 (s, 1H), 7.29 (d, 1H, J = 8.7Hz),

6.74 (d, 1H, J = 3.0 Hz), 6.55 (dd, 1H, J = 8.7, 3.0 Hz), 4.71 (t, 1H, J = 5.4Hz), 3.52-

3.59 (m, 2H), 2.73 (t, 2H, J = 7.2Hz).

(ii)
15

Preparation of 2-[2-Bromo-5-(2-trimethylsilanyl-ethoxymethoxy)-phenyl] was

prepared in 65% yield by the substitution of 4-bromo-3-(2-hydroxy-ethyl)-phenol in

the procedure described in Example 24(a), step (vi). ¹H NMR (300 MHz, CDCl₃) δ

7.43 (d, 1H, J = 8.7Hz), 6.97 (d, 1H, J = 3.0 Hz), 6.82 (dd, 1H, J = 8.7, 3.0 Hz), 5.19

(s, 2H), 3.88 (q, 2H, J = 6.6Hz), 3.74 (t, 2H, J = 8.4Hz), 2.99 (t, 2H, J = 6.6Hz), 1.42

(t, 1H, J = 6.6Hz). 0.94 (t, 2H, J = 8.4Hz), -0.01 (s, 9H).

(iii)
5   {2-[4-Bromo-3-(2-methoxy-ethyl)-phenoxymethoxy]-ethyl}-trimethyl-silane: 2-[2-

Bromo-5-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-ethanol (1.9 g, 6.0 mmol) was

added to a solution of potassium hydroxide (1.35 g, 24 mmol) in DMSO (16 mL).

Iodomethane (1.12 mL, 18 mmol) was added, and the solution stirred for 16 h. The

reaction was diluted with water (50 mL) and extracted with ether (2 x 40 mL).

10   Organics were washed with brine (40 mL), dried (Na$_2$SO$_4$) and concentrated *in vacuo*.

Purification by silica gel chromatography (10% ether/hexanes) gave 1.28 g of {2-[4-

bromo-3-(2-methoxy-ethyl)-phenoxymethoxy]-ethyl}-trimethyl-silane as a clear oil.

^{1}H NMR (300 MHz, CDCl$_3$) δ 7.40 (d, 1H, J = 8.7Hz), 6.96 (d, 1H, J = 3.0 Hz), 6.80

(dd, 1H, J = 8.7, 3.0 Hz), 5.18 (s, 2H), 3.74 (t, 2H, J = 8.4Hz), 3.60 (t, 2H, J =

15   7.2Hz), 3.37 (s, 3H), 2.98 (t, 2H, J = 7.2Hz), 0.95 (t, 2H, J = 8.4Hz), -0.01 (s, 9H).

Example 24(i): 3-1*H*-Benzoimidazol-2-yl-6-(2-(2-hydroxyethyl)-4-

hydroxyphenyl)- 1*H*-indazole
3-1*H*-Benzoimidazol-2-yl-6-(2-(2-methoxyethyl)-4-hydroxyphenyl)-1*H*-

indazole, from Example 24(i), (99 mg, 0.26 mmol) was dissolved in EtOAc (20 mL)

and cooled to −78 °C under argon. Boron tribromide was added dropwise, and the

5   reaction was allowed to stir while warming to r.t over 3 h. The solution was diluted

with EtOAc (60 mL) and washed with sat NaHCO$_3$ and brine (20 mL each). Organics

were dried (Na$_2$SO$_4$) and concentrated *in vacuo*. Purification by silica gel

chromatography (THF) gave 56 mg (59%) of the title compound as a white solid. ^{1}H

NMR (300 MHz, DMSO-d_6) δ 13.60 (s, 1H), 13.01 (s, 1H), 9.41 (s, 1H), 8.49 (d, 1H,

10   J = 8.4Hz), 7.71 (br s, 1H), 7.51 (br s, 1H), 7.46 (s, 1H), 7.21 (app d, 3H, J = 8.1Hz),

7.08 (d, 1H, J = 8.4Hz), 6.77 (d, 1H, J = 2.1Hz), 6.69 (dd, 1H, J = 8.1, 2.1Hz), 4.57

(br s, 1H), 3.46 (t, 2H, J = 7.2Hz), 2.68 (t, 2H, J = 7.2Hz). MS (ES) [m+H]/z calc'd

371, found 371; [m-H]/z calc'd 369, found 369.

Example 24(j): 3-1*H*-Benzoimidazol-2-yl-6-(2,6-dimethyl-4-hydroxyphenyl)- 1*H*-

15   **indazole**
Example 24 (j) was prepared in a similar manner to that described for

Example 24(a), except that 4-bromo-3,5-dimethyl -phenol was used instead of 4-

bromo-2-methoxy-5-methyl-phenol in step (vi). ^{1}H NMR (300 MHz, DMSO-d_6) δ

5   13.57 (s, 1H), 12.99 (s, 1H), 9.22 (s, 1H), 8.52 (d, 1H, J = 8.4Hz), 7.72 (d, 1H, J =

6.6Hz), 7.51 (d, 1H, J = 6.6Hz), 7.31 (s, 1H), 7.16-7.25 (m, 2H), 7.02 (d, 1H, J =

8.4Hz), 6.55 (s, 2H), 1.93 (s, 6H). MS (ES) [m+H]/z calc'd 355, found 355; [m-H]/z

calc'd 353, found 353.

Example 24(k): 3-1H-Benzoimidazol-2-yl-6-(2-methylsulfanyl-4-hydroxyphenyl)-

10   **1H-indazole**
Example 24 (k) was prepared in a similar manner to that described for

Example 24(c), except that 3-methylsulfanyl-phenol, prepared as described below,

was used instead of 2-chloro-5-methyl-phenol in step (i). ^{1}H NMR (300 MHz,

15   DMSO-d_6) δ 13.59 (s, 1H), 12.98 (s, 1H), 9.64 (s, 1H), 8.48 (d, 1H, J = 8.4Hz), 7.71

(br s, 1H), 7.52 (app s, 2H), 7.20-7.27 (m, 3H), 7.12 (d, 1H, J = 8.4Hz), 6.76 (d, 1H, J

= 2.1Hz), 6.65 (dd, 1H, J = 8.4, 2.1Hz), 2.34 (s, 3H). MS (ES) [m+H]/z calc'd 373, found 373; [m-H]/z calc'd 371, found 371.

The starting material was prepared as follows:

(i)
Preparation of 3-methylsulfanyl-phenol. 3-Hydroxythiophenol (5.0 g, 39.7 mmol) and potassium carbonate (6.03 g, 43.6 mmol) were stirred in acetone (80 mL) at 0 °C. Iodomethane (2.5 mL, 40 mmol) was added dropwise, and the reaction stirred for 45 min. The solution was diluted with H$_2$O (150 mL) and extracted with EtOAc (2 x 100 mL). Organics were washed with brine (100 mL), dried (Na$_2$SO$_4$) and concentrated *in vacuo*. Purification by silica gel chromatography (25% EtOAc/hexanes) 5.08 g (91%) of 3-methylsulfanyl-phenol as a clear oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.15 (t, 1H, J = 8.1Hz), 6.82 (d, 1H, J = 8.1Hz), 6.74 (t, 1H, J = 1.8Hz), 6.60 (dd, 1H, J = 8.1, 1.8Hz), 4.86 (s, 1H), 2.47 (s, 3H).

Example 24(l): 3-1*H*-Benzoimidazol-2-yl-6-(2-(ethoxymethyl)-5-methoxy-4-hydroxy-phenyl)-1*H*-indazole
Example 24 (l) was prepared in a similar manner to that described for

Example 24(a), except that [2-(4-bromo-5-ethoxymethyl-2-methoxy-

phenoxymethoxy)-ethyl]-trimethyl-silane, prepared as described below, was used

instead of [2-(4-bromo-2-methoxy-5-methyl-phenoxymethoxy)-ethyl]-trimethylsilane

5   in step (vii). ^{1}H NMR (300 MHz, DMSO-d_6) δ 13.63 (s, 1H), 12.99 (s, 1H), 9.15 (s,

1H), 8.50 (d, 1H, J = 8.4Hz), 7.73 (dd, 1H, J = 6.6, 2.1Hz), 7.59 (s, 1H), 7.51 (dd,

1H, J = 6.6, 2.1Hz), 7.32 (d, 1H, J = 8.4Hz), 7.19-7.24 (m, 2H), 6.94 (s, 1H), 6.91 (s,

1H), 4.22 (s, 2H), 3.81 (s, 3H), 3.39 (q, 2H, J = 6.9Hz), 1.13 (t, 3H, J = 6.9Hz). MS

(ES) [m+H]/z calc'd 415, found 415.

10   The starting material was prepared as follows:

(i)
2-Bromo-4-methoxy-5-(2-trimethylsilanyl-ethoxymethoxy)-benzaldehyde was

prepared in 79% yield by the substitution of 4-bromo-3-formyl-2-methoxy-phenol

15   (Hazlet et. al., *J. Org. Chem.*, 27, 3253-55 (1962)) in the procedure described in

Example 24(a), step (vi). ^{1}H NMR (300 MHz, CDCl$_3$) δ 10.16 (s, 1H), 7.68 (s, 1H),

7.07 (s, 1H), 5.28 (s, 2H), 3.94 (s, 3H), 3.77 (t, 2H, J = 8.4Hz), 0.94 (t, 2H, J =

8.4Hz), -0.03 (s, 9H).

(ii)
Preparation of [2-(4-Bromo-5-ethoxymethyl-2-methoxy-phenoxymethoxy)-ethyl]-

trimethyl-silane: Sodium borohydride (275 mg, 7.2 mmol) was added in portions

over 10 min to a solution of 2-bromo-4-methoxy-5-(2-trimethylsilanyl-

5   ethoxymethoxy)-benzaldehyde (1.3 g, 3.6 mmol) in MeOH (20 mL) at 0 °C. After 30

min, the reaction was diluted with H_2O (40 mL) and extracted with EtOAc (2 x 30

mL). Organics were washed with brine (30 mL), dried (Na_2SO_4) and concentrated *in*

vacuo to give 1.31g of [2-bromo-4-methoxy-5-(2-trimethylsilanyl-ethoxmethoxy)-

phenyl]-methanol as a clear oil. ^{1}H NMR (300 MHz, $CDCl_3$) δ 7.29 (s, 1H), 7.05 (s,

10   1H), 5.27 (s, 2H), 4.66 (d, 2H, J = 6.6Hz), 3.87 (s, 3H), 3.79 (t, 2H, J = 8.4Hz), 1.92

(t, 1H, J = 6.6Hz), 0.96 (t, 2H, J = 8.4Hz), 0.01 (s, 9H).

The crude benzyl alcohol was stirred with a solution of potassium hydroxide

(800 mg, 14.4 mmol) in DMSO (8 mL). Iodoethane (580 mL, 7.2 mmol) was added,

and the reaction stirred for 16 h before it was diluted with H_2O (30 mL) and extracted

15   with ether (2 x 30 mL). Organics were washed with brine (20 mL), dried (Na_2SO_4)

and concentrated *in vacuo*. Purification by silica gel chromatography (15%

EtOAc/hexanes) gave 1.30 g (92%) of the title compound as a clear oil. ^{1}H NMR

(300 MHz, $CDCl_3$) δ 7.29 (s, 1H), 7.03 (s, 1H), 5.26 (s, 2H), 4.48 (s, 2H), 3.85 (s,

3H), 3.79 (t, 2H, J = 8.4Hz), 3.58 (q, 2H, J = 6.9Hz), 1.26 (t, 3H, J = 6.9Hz), 0.95 (t,

20   2H, J = 8.4Hz), -0.01 (s, 9H).

Example 24(m): 3-1*H*-Benzoimidazol-2-yl-6-(2-(hydroxymethyl)-4-ethoxy-5-

methoxy-phenyl)- 1*H*-indazole
Example 24 (m) was prepared in a similar manner to that described for

5   Example 24(a), except that [2-(2-bromo-5-ethoxy-4-methoxy-benzyloxymethoxy)-

ethyl]-trimethyl-silane, prepared as described below, was used instead of [2-(4-

bromo-2-methoxy-5-methyl-phenoxymethoxy)-ethyl]-trimethylsilane in step (vii). ^{1}H

NMR (300 MHz, DMSO-d_6) δ 13.64 (s, 1H), 13.00 (s, 1H), 8.50 (d, 1H, J = 8.4Hz),

7.73 (d, 1H, J = 8.4Hz), 7.62 (s, 1H), 7.52 (dd, 1H, J = 6.0, 1.8Hz), 7.32 (dd, 1H, J =

10   8.4, 1.2Hz), 7.19-7.24 (m, 2H), 7.15 (s, 1H), 6.91 (s, 1H), 5.11 (t, 1H, J = 5.1Hz),

4.37 (d, 2H, J = 5.1Hz), 4.08 (q, 2H, J = 6.9Hz), 3.80 (s, 3H), 1.37 (t, 3H, J = 6.9Hz).

MS (ES) [m+H]/z calc'd 415, found 415.

The starting material was prepared as follows:

(i)
15

Preparation of 4-bromo-2-methoxy-5-(2-trimethylsilanyl-ethoxymethyl)-

phenol: [2-Bromo-4-methoxy-5-(2-trimethylsilanyl-ethoxmethoxy)-phenyl]-

methanol, upon sitting for periods of over a week, underwent SEM-migration from

the phenolic to the benzylic alcohol to yield the title compound. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.04 (s, 1H), 7.01 (s, 1H), 5.54 (s, 1H), 4.77 (s, 2H), 4.57 (s, 2H), 3.88 (s, 3H), 3.68 (t, 2H, J = 8.4Hz), 0.97 (t, 2H, J = 8.4Hz), 0.02 (s, 9H).

(ii)
Preparation of [2-(2-bromo-5-ethoxy-4-methoxy-benzyloxymethoxy)-ethyl]-trimethyl-silane: 4-Bromo-2-methoxy-5-(2-trimethylsilanyl-ethoxymethyl)-phenol (1.28 g, 3.53 mmol) was stirred with a solution of potassium hydroxide (790 mg, 14.1 mmol) in DMSO (8 mL). Iodoethane (565 mL, 7.1 mmol) was added, and the reaction stirred for 16 h before it was diluted with H$_2$O (30 mL) and extracted with ether (2 x 30 mL). Organics were washed with brine (20 mL), dried (Na$_2$SO$_4$) and concentrated *in vacuo*. Purification by silica gel chromatography (15% EtOAc/hexanes) gave 1.26 g (91%) of the title compound as a clear oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.02 (s, 1H), 6.98 (s, 1H), 4.78 (s, 2H), 4.60 (s, 2H), 4.09 (q, 2H, J = 6.6Hz), 3.86 (s, 3H), 3.69 (t, 2H, J = 8.4Hz), 1.46 (t, 3H, J = 6.6Hz), 0.97 (t, 2H, J = 8.4Hz), 0.04 (s, 9H).

Example 24(n): 3-1H-Benzoimidazol-2-yl-6-(2-(hydroxymethyl)-5-methoxy-4-hydroxy-phenyl)-1H-indazole
Example 24 (n) was prepared in a similar manner to that described for

Example 24(a), except that 6-[5-methoxy-2-hydroxymethyl-4-(2-trimethylsilanyl-

ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-3-[1-(2-

5   trimethylsilanyl-ethoxymethyl)-1H-benzoimidazol-2-yl]-1H-indazole, prepared as

described below, was used instead of 6-[5-methoxy-2-methyl-4-(2-trimethylsilanyl-

ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-3-[1-(2-

trimethylsilanyl-ethoxymethyl)-1H-benzoimidazol-2-yl]-1H-indazole. ^{1}H NMR (300

MHz, DMSO-d_6) δ 13.59 (s, 1H), 12.95 (s, 1H), 9.05 (s, 1H), 8.49 (d, 1H, J = 8.4Hz),

10   7.72 (dd, 1H, J = 6.3, 2.1Hz), 7.60 (s, 1H), 7.51 (dd, 1H, J = 6.3, 2.1Hz), 7.31 (d, 1H,

J = 8.4Hz), 7.20-7.24 (m, 2H), 7.02 (s, 1H), 6.87 (s, 1H), 5.02 (t, 1H, J = 5.4Hz), 4.32

(d, 2H, J = 5.4Hz), 3.80 (s, 3H). MS (ES) [m+H]/z calc'd 387, found 387; [m-H]/z

calc'd 385, found 385.

The starting material was prepared as follows:
15   (i)

Preparation of 4-methoxy-5-(2-trimethylsilanyl-ethoxymethoxy)-2-

trimethylstannanyl-benzaldehyde: 2-Bromo-4-methoxy-5-(2-trimethylsilanyl-

ethoxymethoxy)-benzaldehyde (3.36 g, 9.3 mmol) and hexamethylditin (5.0 g, 15.3

mmol) were stirred in dry toluene (60 mL) in a flask purged with argon.

5   Tetrakis(triphenylphosphine)palladium(0) (500 mg, 0.45 mmol) was added, and the

reaction stirred at 100 °C for 23 h. The reaction was cooled and concentrated *in*

vacuo. Purification by silica gel chromatography (5% EtOAc/hexanes) gave 2.77 g

(67%) of 4-methoxy-5-(2-trimethylsilanyl-ethoxymethoxy)-2-trimethylstannanyl-

benzaldehyde as a clear oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 9.81 (dd, 1H, $J = 3.0$,

10   0.9Hz), 7.66 (t, 1H, $J = 6.6$Hz), 7.21 (t, 1H, $J = 9.0$ Hz), 5.35 (s, 2H), 3.99 (s, 3H),

3.82 (t, 2H, $J = 8.4$Hz), 0.25 (t, 9H, $J = 26.7$Hz), 0.98 (t, 2H, $J = 8.4$Hz), -0.01 (s,

9H).

(ii)
15   Preparation of [4-methoxy-5-(2-trimethylsilanyl-ethoxymethoxy)-2-

trimethylstannanyl-phenyl]-methanol: 4-Methoxy-5-(2-trimethylsilanyl-

ethoxymethoxy)-2-trimethylstannanyl-benzaldehyde (2.36 g, 5.3 mmol) was stirred

in MeOH (30 mL) at 0 °C. Sodium borohydride (400 mg, 10.6 mmol) was added,

and the reaction stirred for 1 h. The solution was diluted with H$_2$O (60 mL), and

20   extracted with EtOAc (2 x 50 mL). Organics were washed with brine (50 mL), dried

(Na$_2$SO$_4$), and concentrated *in vacuo* to give 2.16 g (91%) of [4-methoxy-5-(2-

trimethylsilanyl-ethoxymethoxy)-2-trimethylstannanyl-phenyl]-methanol as a clear

oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.18 (t, 1H, J = 6.9Hz), 7.03 (t, 1H, J = 9.3Hz),

5.27 (s, 2H), 4.58-4.63 (m, 2H), 3.89 (s, 3H), 3.80 (t, 2H, J = 8.4Hz), 1.53 (t, 1H, J =

6.0 Hz), 0.96 (t, 2H, J = 8.4Hz), 0.31 (t, 9H, J = 27.3Hz), 0.01 (s, 9H).

5   (iii)
Preparation of 6-[5-methoxy-2-hydroxymethyl-4-(2-trimethylsilanyl-

ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-3-[1-(2-

trimethylsilanyl-ethoxymethyl)-1H-benzoimidazol-2-yl]-1H-indazole: 6-Iodo-1-[2-

10   (trimethyl-silanyl)-ethoxymethyl]-3-{1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-

benzoimidazol-2-yl}-1H-indazole [Example 24(a), step (v)] (300 mg, 0.48 mmol) and

[4-methoxy-5-(2-trimethylsilanyl-ethoxymethoxy)-2-trimethylstannanyl-phenyl]-

methanol (282 mg, 0.63 mmol) were stirred in dioxane (8 mL) under argon at 98 °C

for 16 h. The reaction was allowed to cool and was diluted with EtOAc. Organics

15   were washed with sat NaHCO$_3$ and brine, dried (Na$_2$SO$_4$), and concentrated *in vacuo*.

Purification by silica gel chromatography (20% EtOAc/hexanes) gave 224 mg (*60%*)

of 6-[5-methoxy-2-hydroxymethyl-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-

(2-trimethylsilanyl-ethoxymethyl)-3-[1-(2-trimethylsilanyl-ethoxymethyl)-1H-

benzoimidazol-2-yl]-1*H*-indazol as a faint yellow oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ

8.70 (d, 1H, *J* = 8.4Hz), 7.89-7.92 (m, 1H), 7.63-7.66 (m, 2H), 7.34-7.41 (m, 4H),

calc'd 357, found 355.

10   **Example 25(a): 3-(3H-Imidazo[4,5-c]pyridin-2-yl)-6-(4-hydroxy-2-**
methoxyphenyl)-1*H*-indazole

A solution of of 6-[5-methoxy--2-methyl-4-(2-trimethylsilanyl-

ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-3-[3-(2-trimethylsilanyl-

15   ethoxymethyl)-3H-imidazo[4,5-c]pyridin-2-yl]-1*H*-indazole (68 mg, 0.11 mmol) in

TBAF (1 M in THF, 1.2 mL, 1.2 mmol) with ethylenediamine (150 mL, 2.2 mmol)

was stirred at 68 °C for 48 h. The solution was concentrated *in vacuo* and purified by

silica gel chromatography (2:1 EtOH/EtOAc). Precipitation from acetonitrile gave 21

mg (53%) of 3-(3H-imidazo[4,5-c]pyridin-2-yl)-6-(4-hydroxy-2-methoxyphenyl)-1*H*-indazole as a white solid. ^{1}H NMR (300 MHz, DMSO-d_6) δ 13.70 (s, 1H), 13.49 (br s, 1H), 9.62 (s, 1H), 9.01 (br s, 1H), 8.43 (d, 1H, J = 8.7Hz), 8.34 (d, 1H, J = 5.7Hz), 7.64 (s, 1H), 7.57 (br s, 1H), 7.39 (dd, 1H, J = 8.7, 1.5Hz), 7.21 (d, 1H, J = 8.1Hz),

5   6.55 (d, 1H, J = 2.1Hz), 6.49 (dd, 1H, J = 8.1, 2.1Hz), 3.74 (s, 3H). MS (ES) [m+H]/z calc'd 358, found 358; [m-H]/z calc'd 356, found 356.

The intermediates were prepared as follows:

(i)
10   **3-(1,1-Dimethoxy-methyl)-6-iodo-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole.** A solution of 6-iodo-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1*H*-indazole [Example 14, step (i)] (1.28 g, 2.69 mmol) in CH$_2$Cl$_2$ (40mL)/MeOH (40 mL) was stirred at -78 °C. The reaction was treated with ozone until a blue color persisted, and then was purged with argon. Methyl sulfide (4 mL) was added, and the

15   reaction stirred 4 h while warming to r.t. Concentration *in vacuo* gave a crude mixture of acetal and aldehyde, which was converted completely to the acetal by stirring in trimethyl orthoformate (10 mL) with Amberlyst 15(wet) acidic ion-exchange resin (0.8 g) for 1 h. The resin was removed by filtration, and the solution was concentrated *in vacuo*. Purification by silica gel chromatography gave 1.11 g

20   (92%) of 3-(1,1-dimethoxy-methyl)-6-iodo-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-

indazole as a clear oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.98 (s, 1H), 7.68 (d, 1H, J = 8.4Hz), 7.48 (dd, 1H, J = 8.4, 1.2Hz), 5.77 (s, 1H), 5.69 (s, 2H), 3.53 (t, 2H, J = 8.4Hz), 3.43 (s, 6H), 0.88 (t, 2H, J = 8.4Hz), -0.06 (s, 9H).

(ii)
5

3-(1,1-Dimethoxy-methyl)-6-[2-methoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole. 3-(1,1-Dimethoxy-methyl)-6-iodo-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole (1.06 g, 2.37 mmol), 2-methoxy-4-(trimethylsilanyl-ethoxymethoxy)-phenylboronic acid (0.99 g, 3.32

10   mmol), and sodium carbonate (352 mg, 1.4 mmol) were stirred in a mixture of benzene (15 mL), MeOH (3 mL), and water (1 mL) in a flask purged with argon. Tetrakis(triphenylphosphine)palladium(0) (220 mg, 0.19 mmol) was added, and the reaction stirred at reflux for 16 h. The reaction was allowed to cool and was diluted with ether (70 mL). Organics were washed with H$_2$O and brine (30 mL each), dried

15   (Na$_2$SO$_4$), and concentrated *in vacuo*. Purification by silica gel chromatography (15% EtOAc/hexanes) gave 1.12 g (82%) of 3-(1,1-dimethoxy-methyl)-6-[2-methoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole as a faintly yellow oil. ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.91 (d, 1H, J = 8.4Hz), 7.64 (s, 1H), 7.37 (dd, 1H, J = 8.4, 1.2Hz), 7.29 (d, 1H, J = 8.4Hz), 6.71-6.77

(m, 2H), 5.82 (s, 1H), 5.75 (s, 2H), 5.28 (s, 2H), 3.77-3.83 (m, 5H), 3.57 (t, 2H, *J* =

8.4Hz), 3.46 (s, 6H), 1.00 (t, 2H, *J* = 8.4Hz), 0.88 (t, 2H, *J* = 8.4Hz), 0.03 (s, 9H), -

0.05 (s, 9H).

(iii)
6-[2-Methoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-indazole-3-carbaldehyde. 3-(1,1-Dimethoxy-

methyl)-6-[2-methoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-indazole (1.1 g, 1.92 mmol) was stirred in 1%

TFA/CH₂Cl₂ (20 mL) for 1 h at rt. Concentration *in vacuo* yielded 1.01 g (100%) of

6-[2-methoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-

ethoxymethyl)-1*H*-indazole-3-carbaldehyde as a clear oil. ¹H NMR (300 MHz,

CDCl₃) δ 10.27 (s, 1H), 8.28 (d, 1H, *J* = 8.4Hz), 7.73 (s, 1H), 7.55 (dd, 1H, *J* = 8.4,

1.2Hz), 7.29 (d, 1H, *J* = 8.4Hz), 6.72-6.79 (m, 2H), 5.82 (s, 2H), 5.28 (s, 2H), 3.78-

3.84 (m, 5H), 3.61 (t, 2H, *J* = 8.1Hz), 0.89-1.03 (m, 4H), 0.03 (s, 9H), -0.05 (s, 9H).

(iv)
6-[5-methoxy-2-methyl-4-(2-trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-

trimethylsilanyl-ethoxymethyl)-3-[3-(2-trimethylsilanyl-ethoxymethyl)-3H-

imidazo[4,5-c]pyridin-2-yl]-1H-indazole. 6-[2-Methoxy-4-(2-trimethyl-silanyl-

ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole-3-

5   carbaldehyde (320 mg, 0.61 mmol), 3,4-diamino-pyridine (68 mg, 0.62 mmol), and

sulfur (23 mg, 0.73 mmol) were combined in dry DMF (2 mL) and stirred at 90 °C for

16 h under argon. The reaction was allowed to cool and was diluted with EtOAc (20

mL). Organics were washed with sat. NaHCO$_3$ and brine (15 mL each), dried

(Na$_2$SO$_4$), and concentrated *in vacuo*. Purification by silica gel chromatography (75%

10   to 100% EtOAc/hexanes) gave 78 mg (21%) of 6-[5-methoxy--2-methyl-4-(2-

trimethylsilanyl-ethoxymethoxy)-phenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-3-[3-(2-

trimethylsilanyl-ethoxymethyl)-3H-imidazo[4,5-c]pyridin-2-yl]-1H-indazole as a

white solid. ^{1}H NMR (300 MHz, CDCl$_3$) δ 10.69 (br s, 1H), 9.21 (s, 1H), 8.63 (dd,

1H J = 8.4, 0.3Hz), 8.50 (d, 1H, J = 5.4Hz), 7.73 (s, 1H), 7.47 (br s, 1H), 7.57 (dd,

15   1H, J = 8.7, 1.2Hz), 7.33 (d, 1H, J = 8.4Hz), 6.74-6.80 (m, 2H), 5.80 (s, 2H), 5.29 (s,

(s, 9H).

Example 25(b): 3-[6-(2-morpholin-4-yl-ethylcarbamoyl)-1H-benzoimidazol-2-yl]-

6-(2-methoxy-4-hydroxyphenyl)-1H-indazole

20
Example 25 (b) was prepared in a similar manner to that described for Example 25(a),

except that 3,4-diamino-*N*-(2-morpholin-4-yl-ethyl)-benzamide, prepared as described

below, was used instead of 3,4-diaminopyridine in step (iv). ^{1}H NMR (300 MHz,

DMSO-d_6) δ 13.61 (s, 0.5H), 13.59 (s, 0.5H), 13.22 (s, 0.5H), 13.18 (s, 0.5H), 9.59 (s,

5   1H), 8.35-8.46 (m, 2H), 8.27 (s, 0.5H), 8.02 (s, 0.5H), 7.71-7.79 (m, 1.5H), 7.63 (s,

1H), 7.53 (d, 0.5H, *J* = 8.7Hz), 7.38 (d, 1H, *J* = 8.7Hz), 7.21 (d, 1H, *J* = 8.7Hz), 6.55

(d, 1H, *J* = 2.1Hz), 6.49 (dd, 1H, *J* = 8.4, 2.1Hz), 3.75 (s, 3H), 3.58 (t, 4H, *J* = 4.5Hz),

3.42 (q, 2H, *J* = 6.0 Hz), 2.43-2.51 (m, 6H). MS (ES) [m+H]/z calc'd 513, found

513; [m-H]/z calc'd 511, found 511.

10   3,4-Diamino-*N*-(2-morpholin-4-yl-ethyl)-benzamide was prepared as follows:
3,4-Diamino-*N*-(2-morpholin-4-yl-ethyl)-benzamide.   3,4-Diaminobenzoic acid (5

g, 32.9 mmol), 4-(2-aminoethyl)morpholine (5.2 mL, 39.4 mmol), triethylamine (9.2

mL, 66 mmol), and DMAP (0.40 g, 3.3 mmol) were combined in dry DMF (80 mL) at

15   0 °C. EDC (9.45 g, 49.3 mmol) was added, and the reaction stirred for 24 h at r.t.

Concentration *in vacuo* and purification by silica gel chromatography (10%

MeOH/CH$_2$Cl$_2$ with 0.2% NH$_4$OH) gave 2.6 g (31%) of 3,4-diamino-*N*-(2-morpholin-

4-yl-ethyl)-benzamide as a light brown solid. ^{1}H NMR (300 MHz, DMSO-d_6) δ 7.72

(t, 1H, *J* = 5.4Hz), 7.02 (d, 1H, *J* = 1.8Hz), 6.92 (dd, 1H, *J* = 8.1, 1.8Hz), 6.46 (d, 1H,

20   *J* = 8.1Hz), 4.89 (br s, 2H), 4.51 (br s, 2H), 3.55 (t, 4H, *J* = 4.8Hz), 3.29 (q, 2H, *J* =

7.2Hz), 2.36-2.43 (m, 6H).

Example 25(c): 3-[6-(4-methylpiperazin-1-yl)-1*H*-benzoimidazol-2-yl]-6-(2-methoxy-4-hydroxyphenyl)- 1*H*-indazole
Example 25 (c) was prepared in a similar manner to that described for Example 25(a),

5   except 4-(4-methyl-piperazin-1-yl)-benzene-1,2-diamine (Harapanhalli et al., *J. Med.*

Chem., 39, 4804-09 (1996)) was used instead of 3,4-diaminopyridine in step (iv). ^{1}H

NMR (300 MHz, DMSO-d_6) δ 13.51 (s, 0.33H), 13.38 (s, 0.67H), 12.66 (s, 0.33H),

12.59 (s, 0.67H), 9.58 (s, 1H), 8.42 (d, 0.33H, J = 8.4Hz), 8,41 (d, 0.67H, J = 8.4Hz),

7.59 (s, 1H), 7.55 (d, 0.67H, J = 8.7Hz), 7.31-7.37 (m, 1.33H), 7.20 (app d, 1.33H, J

10   = 8.4Hz), 6.92-7.01 (m, 1.67H), 6.55 (d, 1H, J = 1.5Hz), 6.48 (dd, 1H, J = 8.4,

2.1Hz), 3.74 (s, 3H), 3.12 (br s, 4H), 2.50 (br s, 4H), 2.22 (s, 3H). MS (ES) [m+H]/z

5.28 (s, 2H), 3.78-3.86 (m, 5H), 3.60 (t, 2H, *J* = 8.4Hz), 0.88-1.03 (m, 4H), 0.03 (s,

15   9H), -0.05 (s, 9H).

**Example 25(f): 3-[4-(2-hydroxyethylsulfanyl)-1*H*-benzoimidazol-2-yl]-6-(2-
methoxy-4-hydroxyphenyl)-1*H*-indazole**

159
Example 25 (f) was prepared in a similar manner to that described for Example 25(a),

except that 2-(2,3-diamino-phenylsulfanyl)-ethanol) was used instead of 3,4-

diaminopyridine in step (iv). ^{1}H NMR (300 MHz, DMSO-d_6) δ 13.51 (s, 1H), 13.02

(s, 1H), 9.59 (s, 1H), 8.45 (d, 1H, J = 8.4Hz), 7.61 (s, 1H), 7.32-7.40 (m, 2H), 7.11-

5   7.23 (m, 3H), 6.55 (d, 1H, J = 2.4Hz), 6.48 (dd, 1H, J = 8.1, 2.4Hz), 4.96 (br s, 1H),

3.75 (s, 3H), 3.65 (br s, 2H), 3.33 (t, 2H, J = 6.9Hz). MS (ES) [m+Na]/z calc'd 455,

found 455, [m-H]/z calc'd 431, found 431.

The starting material was prepared as follows:
10   **2-(3-Amino-2-nitro-phenylsulfanyl)-ethanol.** 3-Chloro-2-nitro-aniline (1.12 g, 6.5

mmol), 2-mercaptoethanol (0.60 ml, 8.6 mmol), and potassium carbonate (0.99 g, 7.1

mmol) were combined in dry DMF (15 ml) and stirred at 130 °C for 4 h. The solution

was allowed to cool and was concentrated *in vacuo*. Purification by silica gel

chromatography (70% EtOAc/hexanes) gave 1.29 g (93%) of 2-(3-amino-2-nitro-

15   phenylsulfanyl)-ethanol as a bright red solid. ^{1}H NMR (300 MHz, DMSO-d_6) δ 7.20

(t, 1H, J = 8.1Hz), 6.80 (s, 2H), 6.73 (dd, 1H, J = 8.4, 0.9Hz), 6.63 (dd, 1H, J = 7.8,

1.2Hz), 4.92 (t, 1H, J = 6.0 Hz), 3.58 (q, 2H, J = 6.0 Hz), 2.98 (t, 2H, J = 6.0 Hz).

2-(2,3-Diamino-phenylsulfanyl)-ethanol. 2-(3-Amino-2-nitro-phenylsulfanyl)-

ethanol (1.02 g, 4.8 mmol) was reduced by hydrogenation using 45 psi of H_2 with

20   10% Pd-C (180 mg) in EtOAc (25 mL) for 6 h. After filtering through Celite, solvent

was removed *in vacuo*. Purification by silica gel chromatography (EtOAc) gave 762

mg (87%) of 2-(2,3-diamino-phenylsulfanyl)-ethanol as a faintly yellow solid. ¹H

NMR (300 MHz, CDCl₃) δ 6.98 (dd, 1H, J = 7.5, 1.5Hz), 6.60-6.72 (m, 2H), 3.65 (t,

2H, J = 5.7Hz), 3.55 (br s, 5H), 2.91 (t, 2H, J = 5.7Hz).

Example 25(g): 3-(5-methylcarbamoyl-1H-benzoimidazol-2-yl)-6-(2-methoxy-4-

5 **hydroxyphenyl)-1H-indazole**
Example 25 (g) was prepared in a similar manner to that described for Example 25(a),

except 3,4-diamino-N-methyl-benzamide (Kumar, et. al. *J. Med. Chem.*, 27, 1083-89

(1984)) was used instead of 3,4-diaminopyridine in step (iv). ¹H NMR (300 MHz,

10 DMSO-d_6) δ 13.59 (s, 0.5H), 13.55 (s, 0.5H), 13.21 (s, 0.5H), 13.14 (s, 0.5H), 9.60 (s,

1H), 8.38-9.46 (m, 2H), 8.26 (s, 0.5H), 8.03 (s, 0.5H), 7.71-7.79 (m, 1.5H), 7.63 (s,

The starting material was prepared as follows:
(i)

3-Iodo-6-(3-methoxy-4-methoxymethoxy-phenyl)-1-[2-(trimethyl-silanyl)-

5   ethoxymethyl]-1H-indazole was prepared from the compound prepared in Example

1(a), step (v) in a similar manner to that described for Example 10, step (ii): R_f sm

0.11, p 0.43 (ethyl acetate-hexane 3:7); ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.71 (s, 1H),

7.55 (m, 2H), 7.33 (m, 1H), 7.20 (m, 2H), 5.82 (s, 2H), 5.33 (s, 2H), 4.02 (s, 3H),

3.64 (t, 2H), 3.59 (s, 3H), 0.95 (t, 2H), -.03 (s, 9H).

10   (ii)
3-Styryl-6-(3-methoxy-4-methoxymethoxy-phenyl)-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1H-indazole was prepared in a similar manner to that described for

Example 11, step (iii): R_f sm 0.41, p 0.35 (ethyl acetate-hexane 2:8); ^{1}H NMR (300

15   MHz, CDCl$_3$) δ 8.12 (d, 1H), 7.73 (s, 1H), 7.62 (m, 2H), 7.51 (m, 2h), 7.46 (m, 2H),

7.38 (m, 1H), 7.30 (m, 4H), 5.85 (s, 2H), 5.38 (s, 2H), 4.03 (s, 3H), 3.70 (t, 2H), 3.62

(s, 3H), 0.98 (t, 2H), -0.02 (s, 9H).

(iii)
3-Carboxaldehyde-6-(3-methoxy-4-methoxymethoxy-phenyl)-1-[2-(trimethyl-silanyl)-

ethoxymethyl]-1*H*-indazole was prepared in a similar manner to that described for

Example 33(a), step (i): ^{1}H NMR (300 MHz, CDCl$_3$) δ 10.33 (s, 1H), 8.34 (d, 1H),

5   7.82 (s, 1H), 7.65 (d, 1H), 7.25 (m, 3H), 5.90 (s, 2H), 5.36 (s, 2H), 4.02 (s, 3H), 3.67

(t, 2H), 3.51 (s, 3H), 0.98 (t, 2H), -0.02 (s, 9H).

(iv)
3-(4-Nitrostyryl)-6-(3-methoxy-4-methoxymethoxy-phenyl)-1-[2-(trimethyl-silanyl)-

10   ethoxymethyl]-1*H*-indazole was prepared in a similar manner to that described for

Example 33(a), step (ii) except that 4-nitrobenzyltriphenylphosphonium bromide and

lithium hexamethyldisilazide were used instead of 2-picolyltriphenylphosphonium

chloride-potassium hydride: LCMS (100% area) Rt = 6.89 min, (pos) [M+H]/z Calc'd

562.4, found 562.4.
15   (v)

3-(4-Nitrostyryl)-6-(3-methoxy-4-methoxymethoxy-phenyl)- 1H-indazole was

prepared in a similar manner to that described for Example 11: FTIR (thin film) 3335,

3178, 2954, 1592, 1512, 1338, 1257, 1136, 1257, 1136, 987 cm^{-1}; ^{1}H NMR (300

MHz, CDCl$_3$) δ 8.22 (d, 2H, J = 8.8 Hz), 8.02 (d, 1H, J = 8.5 Hz), 7.70 (d, 2H, J = 8.8

5   Hz), 7.58 (m, 3H), 7.45 (dd, 1H, J = 1.3, 8.5 Hz), 7.20 (m, 4H), 7.26 (s, 2H), 3.95 (s,

3H), 3.53 (s, 3H); LCMS (100% area) Rt = 5.13 min, (pos) [M+H]/z Calc'd 432.1,

found 432.1.

(vi)
10   3-(4-aminostyryl)-6-(3-methoxy-4-methoxymethoxy-phenyl)- 1H-indazole was

prepared in a similar manner to that described for Example 11, step (iv): R$_f$ sm 0.39,

p 0.26 (ethyl acetate-hexane 6:4); FTIR (thin film) 3366, 3210, 2954, 1608, 1517,

1465, 1412, 1259, 1157, 1077, 989, 912 cm^{-1}; ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.11 (d,

1H), 7.63 (s, 1H), 7.50-7.15 (m, 8H), 6.71 (d, 2H), 5.36 (s, 2H), 3.97 (s, 3H), 3.61 (s,

15   3H); LCMS (100% area) Rt = 4.40 min, (pos) [M+H]/z Calc'd 402.2, found 402.2.

(vii)
3-(4-aminostyryl)-6-(3-methoxy-4-methoxymethoxy-phenyl)- 1H-indazole (90 mg,

0.224 mmol) was dissolved in dichloromethane (2 mL) and was treated with Boc-

glycine (196 mg, 1.12 mmol, 5 equiv), DMAP (82 mg, 3 equiv) and HATU (426 mg,

5 equiv). The mixture was allowed to stir for 30 min. The mixture was partitioned

5   between ethyl acetate and water. The organic material was concentrated, taken up in

methanol (5 mL) and was treated with potassium carbonate (100 mg). The mixture

was heated to 50 °C for 3 d. The resulting mix was again partitioned between ethyl

acetate and water. The organic material was concentrated, and purified by silica (109

mg, 66%): R$_f$ sm 0.32, p 0.46 (ethyl acetate-hexane 6:4); ^{1}H NMR (300 MHz,

10   CDCl$_3$) • 8.18 (bs, 1H), 8.03 (d, 1H, J = 8.1 Hz), 7.56 (m, 5H), 7.40 (m, 3H), 7.20 (m,

3H), 5.29 (s, 2H), 5.20 (bs, 1H), 3.98 (s, 3H), 3.96 (d, 2H), 3.54 (s, 3H), 1.48 (s, 9H).

Example 27(a): 6-phenyl-3-E-styryl-1H-indazole
6-phenyl-3-styryl-1-[2-(trimethyl-silanyl)ethoxymethyl]-1H- indazole (345 mg,

15   0.81 mmol) was treated with a solution of TBAF (16 ml of a 1 M solution in THF, 16

mmol), and ethylene diamine (0.53 ml, 8.1 mmol), and heated at 70 °C for 2 h. The

solution was then poured into brine (200 ml), and extracted with ethyl acetate (3x30

ml). The organic layer was dried over MgSO$_4$, and concentrated under reduced

pressure. Purification by silica gel chromatography gave 6-phenyl-3-E-styryl-1H-

20   indazole as a white solid (80 mg, 34%): ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.10 (d, 1H, J

= 8.5 Hz); HRMS (FAB) [M+H]/z Calc'd 297.1392, found 297.1393. Anal. Calc'd, C

(85.10), H (5.44), N (9.45). Found: C (85.10), H (5.46), N (9.43).

The starting material was prepared as follows:

(i)

5
A solution of 476 mg (1.0 mmol) of 6-iodo-3-styryl-1-[2-(trimethyl-

silanyl)ethoxymethyl]-1H- indazole, from Example 14 step (i), in dioxane (3 ml,

degassed by sonication and bubbling argon), Pd(PPh$_3$)$_4$ (23 mg, 0.05 mmol),

phenylboronic acid (302 mg, 2.5 mmol), and Na$_2$CO$_3$ (1.25 ml of a 2M aqueous

10   solution, degassed as above) was heated at 90 °C for 2 h. The solution was then

diluted with ethyl acetate (100 ml) and washed with brine (2x20 ml). The organic

layer was dried over MgSO$_4$, and concentrated under reduced pressure. Purification

by silica gel chromatography gave of 6-phenyl-3-styryl-1-[2-(trimethyl-

silanyl)ethoxymethyl]-1H- indazole as a brown oil (345 mg, 81%). ^{1}H NMR (300

15   MHz, CDCl$_3$) δ 8.09 (dd, 1H, J=8.5, 0.7 Hz), 7.75 (s, 1H), 7.70 (d, 1H, J=7.0 Hz),

7.64-7.58 (m, 2H), 7.56-7.51 (m, 2H), 7.50-7.45 (m, 2H), 7.45-7.36 (m, 4H), 7.34-

7.27 (m, 1H), 5.80 (s, 2H), 3.73 (t, 2H, J=8.3Hz), 1.12 (t, 2H, J=8.3Hz).

Example 27(b): 6-(3-methoxyphenyl)-3-E-styryl-1H-indazole
Example 27 (b) was prepared in a similar manner to that described for

Example 27(a), except that 3-methoxyphenylboronic acid was used instead of

phenylboronic acid in step (i). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.16 (d, 1H, J=8.4

5   Hz), 7.70 (s, 1H), 7.67-7.61 (m, 2H), 7.60-7.43 (m, 3H), 7.43-7.33 (m, 3H), 7.32-7.21

(m, 3H), 6.99-6.92 (m, 1H), 3.88 (s, 3H). HRMS (FAB) [M+Na]/z Calc'd 349.1317,

found 349.1342. Analyzed with 0.1 H$_2$O Calc'd, C (80.50), H (5.59), N (8.55).

Found: C (80.44), H (5.49), N (8.55).

Example 27(c): 6-(4-methoxyphenyl)-3-E-styryl-1H-indazole
10

Example 27 (b) was prepared in a similar manner to that described for

Example 27(a), except that 4-methoxyphenylboronic acid was used instead of

phenylboronic acid in step (i). ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 13.20 (s, 1H), 8.23

(d, 1H, J=8.4 Hz), 7.76-7.64 (m, 5H), 7.54 (s, 1H), 7.50-7.37 (m, 3H), 7.33-7.25 (m,

15   1H), 7.07 (d, 2H, J=8.8 Hz), 3.82 (s, 3H) HRMS (FAB) [M+H]/z Calc'd 327.1497,

found 327.1502. Anal. Calc'd, C (80.96), H (5.56), N (8.58). Found: C (80.71), H

(5.42), N (8.47).

Example 27(d): 6-naphth-1-yl-3-E-styryl-1H-indazole

170
Example 27 (d) was prepared in a similar manner to that described for

Example 27(a), except that 1-naphthaleneboronic acid was used instead of

phenylboronic acid in step (i) ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 10.11 (s, 1H), 8.45

5   (d, 1H. J=8.41), 7.97-7.87 (m, 3H), 7.66-7.37 (m, 13H), 7.35-7.28 (m, 1H). HRMS

(FAB) [M+Na]/z Calc'd 369.1368, found 369.1359. Anal. Calc'd C (86.68), H (5.32),

N (8.19). Found: C (86.52), H (5.32), N (8.19).

Example 27(e) 6-pyridin-3-yl-3-E-styryl-1*H*-indazole
10   Example 27 (e) was prepared in a similar manner to that described for

Example 27(a), except that 3-pyridineboronic acid was used instead of phenylboronic

acid in step (i). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.97 (s, 1H), 8.63 (d, 1H, J=4.8

Hz), 8.30 (d, 1H, H=8.5 Hz), 8.27 (d, 1H, J=8.1 Hz), 7.86 (s, 1H), 7.72 (d, 2H, J=7.5

Hz), 7.69-7.56 (m, 4H), 7.54-7.42 (m, 2H), 7.40-7.32 (m, 1H). HRMS (FAB)

15   [M+H]/z Calc'd 298.1344, found 298.1356. Analyzed with 0.25 H$_2$O Calc'd, C

(79.58), H (5.18), N (13.92). Found: C (79.53), H (5.16), N (13.80).

Example 27(f) 6-pyridin-4-yl-3-E-styryl-1*H*-indazole

171
Example 27(f) was prepared in a similar manner to that described for Example

27(a), except that 4-pyridineboronic acid was used instead of phenylboronic acid in

step (i). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.69 (bs, 2H), 8.30 (d, 1H, J=8.5 Hz), 7.96

5   (s, 1H), 7.87 (d, 2H, H=5.6 Hz), 7.75-7.68 (m, 3H), 7.68-7.50 (m, 2H), 7.50-7.42 (m,

2H), 7.40-7.31 (m, 1H). HRMS (FAB) [M+H]/z Calc'd 298.1344, found 298.1357.

Analyzed with 0.3 H$_2$O Calc'd, C (79.34), H (5.19), N (13.88). Found: C (79.14), H

(5.08), N (13.84).

Example 27(g): 6-indol-4-yl-3-E-styryl-1H-indazole

10
Example 27(g) was prepared in a similar manner to that described for Example

27(a), except that 4-indoleboronic acid was used instead of phenylboronic acid in step

(i). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.25 (d, 1H, J=8.5 Hz), 7.85 (s, 1H), 7.75-7.67

(m, 3H), 7.67-7.52 (m, 2H), 7.52-7.42 (m, 3H), 7.39-7.22 (m, 4H), 6.72 (d, 1H, J=3.2

15   Hz). HRMS (FAB) [M+H]/z Calc'd 336.1501, found 336.1506. Analyzed with 0.3

H$_2$O Calc'd, C (78.97), H (5.36), N (12.01). Found: C (78.95), H (5.20), N (12.03).

Example 27(h): 6-[3-ethoxy-4-hydroxyphenyl]-3-E-styryl-1H-indazole
Example 27(h) was prepared in a similar manner to that described for Example

27(a), except that 3-ethoxy-4-(2-trimethylsilanyl-ethoxymethoxy)benzene boronic acid

was used instead of phenylboronic acid in step (i). ^{1}H NMR (300 MHz, CDCl$_3$) δ

5   8.10 (d, 1H, J=8.7 Hz), 7.74 (s, 1H), 7.74-7.16 (m, 10H), 7.07 (d, 1H, J=8.15 Hz),

4.27 (q, 2H, J=14.0 Hz), 1.54 (t, 3H, J= 14.0 Hz). HRMS (FAB) [M+H]/z Calc'd

357.1603, found 357.1611. Analyzed with 0.2 H$_2$O, Calc'd, C (76.73), H (5.71), N

(7.78). Found: C (76.72), H (5.91), N (7.63).

Starting material was prepared as follows:

10   (i)
4-Bromo-2-ethoxy-phenol (Smith et al., *Soc. Pl.*, 1877-78 (1992)) was converted to

3-ethoxy-4-(2-trimethylsilanyl-ethoxymethoxy)-benzene boronic acid in a manner

similar to that described for Example 24(a) steps (vi)-(vii). ^{1}H NMR (300 MHz,

15   CDCl$_3$) δ 7.82 (d, 1H, J= 8.0 Hz), 7.72 (s, 1H), 7.31 (d, 1H, J= 8.1 Hz), 5.37 (s, 2H),

4.29 (q, 2H, J= 14.0 Hz), 3.87 (t, 2H, J= 16.8 Hz), 1.54 (t, 2H, J= 14.0 Hz), 0.99 (t,

2H, J=16.8 Hz), 0.03 (s, 9H).

Example 27(i): 6-[3-(2-hydroxyethoxy)-4-hydroxyphenyl]-3-E-styryl-1H-indazole
Example 27(i) was prepared in a similar manner to that described for Example

27(a), except that 3-[2-(trimethylsilanyl-ethoxymethoxy)-ethoxy]-4-(2-

trimethylsilanyl-ethoxymethoxy)-benzene boronic acid, prepared from 2-(2-hydroxy-

5   ethoxy)-phenol (Yamaguchi et al., *Bull. Chem. Soc. Jpn.*, 61, 2047-54 (1988)) in a

similar manner to that described in Example 24(c) steps (i)-(iii) and was used instead

of phenylboronic acid in step (i). ^{1}H NMR (300 MHz, DMSO-d_6) δ 8.17 (d, 1H,

J=8.7 Hz), 7.73- 7.17 (m, 11 H), 6.92 (d, 1H, J=8.2 Hz), 4.13 (t, 2H, J=9.7 Hz), 3.8 (t,

2H, J=9.7 Hz). HRMS (FAB) [M+H]/z Calc'd 373.1552, found 373.1563. Analyzed

10   with 0.05 trifluoroacetic acid, Calc'd, C (73.37), H (5.35), N (7.41). Found: C

(73.11), H (5.33), N (7.39).

Example 27(j): 6-(3,4-dimethoxyphenyl)-3-E-styryl-1H-indazole
Example 27 (j) was prepared in a similar manner to that described for Example

15   27(a), except that 3,4-dimethoxyphenylboronic acid was used instead of

phenylboronic acid in step (i). ^{1}H NMR (300 MHz, DMSO-d_6) δ 8.01 (d, 1H, J=8.1

Hz), 7.51-7.05 (m, 11H), 6.86 (d, 1H, J=8.0 Hz) 3.58 (s, 3H), 3.65 (s, 3H). HRMS

(FAB) [M+H]/z Calc'd 357.1598, found 357.1508. Analyzed with 0.2 H$_2$O, Calc'd,

C (76.73), H (5.71), N (7.78). Found: C (76.45), H (5.70), N (7.68).

Example 27(k): 6-(2-methoxypyridin-5-yl)-3-E-styryl-1H-indazole
5   6-(2-methoxypyridin-5-yl)-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-

1H-indazole was converted to 6-(2-methoxypyridin-5-yl)-3-E-styryl-1H-indazole in a

similar manner to that described for Example 27(a). ^{1}H NMR (300 MHz, CDCl$_3$)

☐☐8.53 (d, 1H, J=2.1 Hz), 8.15 (d, 1H, J=9.2 Hz), 7.97 (dd, 1H, J=2.6, 8.6 Hz), 7.79

(s, 1H), 7.74-7.34 (m, 8H), 6.94 (d, 1H, J=8.6 Hz). HRMS (FAB) [M+H]/z Calc'd

10   328.1450, found 328.1462. Anal. Calc'd, C (77.04), H (5.23), N (12.83). Found: C

(77.00), H (5.28), N (12.65).

The starting material was prepared as follows:

(i)
15   A solution of 5-bromo-2-methoxypyridine (2.00 g, 6.10 mmol), hexamethylditin (1.15

g, 6.10 mmol), and Pd(PPh$_3$)$_4$ (0.28 g, 0.24 mmol) in degassed dioxane (10 ml) was

refluxed under for 16 h. 6-Iodo-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-

indazole (2.90 g, 6.10 mmol) was added to above mixture, followed by Pd(PPh$_3$)$_4$

(0.35 g 0.31 mmol). The reaction mixture was refluxed for 16 h. The mixture was

then diluted with ethyl acetate (150ml), and washed with brine (30 ml). The organics

were dried over $MgSO_4$, then concentrated under reduced pressure. Purification by

silica gel chromatography gave 6-(2-methoxypyridin-5-yl)-3-((E)-styryl)-1-(2-

5   trimethylsilanyl-ethoxymethyl)-1H-indazole as a yellow solid (1.12 g, 40%). ^1H NMR

(300 MHz, $CDCl_3$) δ 8.51 (d, 1H, J= 2.5 Hz), 8.50 (d, 1H, J= 9.1 Hz), 7.93 (dd, 1H,

J=2.5, 8.6 Hz), 7.69 (s,1H), 7.69-7.28 (m, 8H), 6.89 (d, 1H, J=8.6 Hz), 5.83 (s, 2H),

4.03 (s, 3H), 3.64 (t, 2H, J= 8.3 Hz), 0.93 (t, 2H, J= 8.3 Hz), -0.03 (s, 9H).

Example 28(a) 6-(3-hydroxyphenyl)-3-E-styryl-1H-indazole
10

A solution of 100 mg (.3 mmol) 6-(3-methoxyphenyl)-3-E-styryl-1H-indazole,

from Example 27(b), was cooled to –78 °C and treated with BBr_3 (1.8 ml of a 1M

solution in CH_2Cl_2, 1.8 mmol). The resulting solution was held at –78 °C for 15 min,

then warmed to 0 °C, and held 3 h. A solution of saturated aqueous sodium

15   bicarbonate was then added (10 ml), followed by ethyl acetate (50 ml). The organic

layer was washed with brine (20 ml), then concentrated under reduced pressure.

Purification by silica gel chromatography gave 6-(3-hydroxyphenyl)-3-E-styryl-1H-

indazole as a white solid (55 mg, 59%). ^1H NMR (300 MHz, MeOH-d_4) δ 8.16 (d,

1H, J=8.5 Hz), 7.71-7.62 (m, 3H), 7.61-7.44 (m, 3H), 7.43-7.35 (m, 2H), 7.33-7.25

20   (m, 2H), 7.20-7.10 (m, 2H), 6.85-6.79 (m, 1H); δ 13.14 (s, 1H), 9.60 (s, 1H), 8.20 (d,

1H, J=8.4Hz), 7.73 (d, 2H, J=7.3), 7.64-7.52 (m, 5H), 7.47-7.37 (m, 3H), 7.33-7.25

(m, 1H), 6.89 (d, 2H, J=8.6Hz).

Example 28(b): 6-(4-hydroxyphenyl)-3-E-styryl-1H-indazole
5   _ _   6-(4-methoxyphenyl)-3-E-styryl-1H-indazole, from Example 27(c), was

converted to 6-(4-hydroxyphenyl)-3-E-styryl-1H-indazole in a similar manner to that

described for Example 28(a). ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 13.14 (s, 1H), 9.60

(s, 1H), 8.20 (d, 1H, J=8.4 Hz), 7.73 (d, 2H, J=7.3 Hz), 7.64-7.52 (m, 5H), 7.47-7.37

(m, 3H), 7.33-7.25 (m, 1H), 6.89 (d, 2H, J=8.6 Hz). HRMS (FAB) [M+Na]/z Calc'd

10   313.1341, found 313.1347. Analyzed with 0.5 H$_2$O Calc'd, C (78.48), H (5.33), N

Example 29(a): 6-pyrid-4-yl-3-E-[2-(2,6-dichlorophenyl)ethenyl]-1H-indazole
6-Pyrid-4-yl-3-E-[2-(2,6-dichlorophenyl)ethenyl]-1-(2-trimethylsilanyl-

15   ethoxymethyl)-1H-indazole was converted to 6-pyrid-4-yl-3-E-[2-(2,6-

dichlorophenyl)ethenyl]-1H-indazole in a similar manner to that described for

Example 27(a). ^{1}H NMR (300 MHz, CDCl$_3$) δ13.55 (s, 1H), 8.68 (dd, 2H, J=4.6, 1.6

Hz), 8.21 (d, 1H, J=8.5 Hz), 7.96 (s, 1H), 7.81 (dd, 2H, J=4.5, 1.6 Hz), 7.66 (dd, 1H,

J1=8.5, 1.4 Hz), 7.58 (d, 2H, J=8.0 Hz), 7.51 (s, 2H), 7.39-7.32 (m, 1H). MS (FAB)

178

[M+H]/z Calc'd 366, found 366. Analyzed with 0.7 H_2O Calc'd, C (63.40), H (3.83),

N (11.09). Found: C (63.63), H (3.75), N (10.83).

The starting material was prepared as follows:

(i)
5

2, 6-Dichlorobenzyl bromide (1.20 g, 5 mmol) was mixed with triethyl phosphite

(1.66 g, 10 mmol) and heated at 150 °C for 2 h. The resulting mixture was then

distilled at 160 ° C under reduced pressure (10 mm Hg) to remove the excess triethyl

phosphite. (2,6-Dichloro-benzyl)-phosphonic acid diethyl ester was obtained as a

10   colorless liquid (1.46g, 100%). ^{1}H NMR (300 MHz, $CDCl_3$) δ 7.33-7.28 (m, 2H),

7.15-7.07 (m, 1H), 4.14-4.02 (m, 4H), 3.60 (d, 2H, J=22.4Hz), 1.27 (t, 6H, J=7.0Hz).

(ii)
Ozone gas was bubbled through a solution of 6-pyrid-4-yl-3-E-styryl-1-(2-

15   trimethylsilanyl-ethoxymethyl)-1H-indazole (2.13 g, 5.0 mmol) in THF (25 ml) and

MeOH (25 ml) at –78 °C for 15 min. Argon was then bubbled through the solution

for 10 min at –78 °C for 10 min, then dimethyl sulfide (1.46 ml, 20 mmol) was added.

The solution was allowed to warm to rt, and held for 2 h. The solution was poured

into brine (300 ml), then extracted with ethyl acetate (3x100 ml). The organics were

20   dried over $MgSO_4$, then evaporated under reduced pressure. Purification by silica gel

179

chromatography gave 6-pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-

indazole-3-carbaldehyde as a white solid (2.2 g, 75%). ^{1}H NMR (300 MHz, CDCl$_3$) δ

10.39 (s, 1H), 8.75 (d, 2H, J = 1.6 Hz), 8.45 (d, 1H, J = 2.8 Hz), 7.91 (s, 1H), 7.75-

7.66 (m, 3H), 5.90 (s, 2H), 3.63 (t, 2H, J = 2.7 Hz), 0.93 (t, 2H, J = 2.8 Hz), 0.00 (s,

5   9H).

(iii)
A solution of (2,6-dichlorobenzyl)phosphinic acid diethyl ester (582 mg, 2.0 mmol)

in DMF (15 ml) was cooled to 0 °C and treated with NaH (160 mg of 60% in mineral

10   oil, 4.0 mmol). The resulting solution was held at 0 °C for 30 min, then treated with

6-pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole-3-carbaldehyde (353

mg, 1.0 mmol). The resulting solution was allowed to warm to rt over 1h, then held at

rt 2h. The solution was poured into brine (250 ml), then extracted with ethyl acetate

(3x80 ml). The organics were dried over MgSO$_4$, then concentrated under reduced

15   pressure. Purification by silica gel chromatography gave 6-pyrid-4-yl-3-E-[2-(2,6-

dichlorophenyl)ethenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole as a yellow

oil (330 mg, 67 %). ^{1}H NMR (300 MHz, CDCl$_3$) δ 7.72 (dd, 2H, J=4.6, 1.5 Hz), 8.16

(d, 1H, J=8.5 Hz), 7.84 (s, 1H), 7.62 (ss, 2H, J=4.5, 1.6 Hz), 7.60 (s, 2H), 7.56 (dd,

1H, J=8.5, 1.5 Hz), 7.39 (d, 1H, J=8.1 Hz), 7.18-7.12 (m, 1H), 3.64 (t, 2H, J=8.3 Hz),

20   0.92 (t, 2H, J=8.3 Hz), 0.00 (s, 9H).

Example 29(b): 6-pyrid-4-yl-3-E-[2-(3-methylphenyl)ethenyl]-1H-indazole
6-Pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole-3-

carbaldehyde was converted to the desired product in a similar manner to that

described for Example 29(a). ^{1}H NMR (300 MHz, MeOH-d$_4$) 8.88 (d, 1H, J=6.7 Hz),

5   8.41-8.35 (m, 3H), 8.16 (s, 1H), 7.80 (dd, 1H, J=8.6, 1.6 Hz), 7.67-7.48 (m, 4H), 7.35

(t, 1H, J=7.6 Hz), 7.22-7.17 (m, 1H), 4.88 (s, 3H). MS (FAB) [M+H]/z Calc'd 312,

(72.07), H (6.21), N (16.05). Found: C (71.95), H (6.20), N (15.76).

10   The starting material was prepared as follows:
(i) A solution of 1H-pyrrole-2-carbaldehyde (9.5 g, 100 mmol) and THF (500 ml) was

cooled with an ice bath. Bu^{t}ONa (19.2 g, 200 mmol) was added and reaction mixture

was stirred at 0 °C for 1 h. MtsCl (32.7 g, 150 mmol) was then added. The reaction

15   mixture was allowed to warm to rt and held for 2 h at rt. The solution was then treated

with saturated aqueous NH$_4$Cl (100 ml) and the mixture was poured into brine (2 L).

The mixture was extraced with EtOAc (3x300 ml). The combined organic layer was

dried over MgSO4 and concentrated under reduced pressure. The resulting oil was

purified by silica gel chromatography to yield 1-(2,4,6-trimethyl-benzenesulfonyl)-1H-

20   pyrrole-2-carbaldehyde as a light yellow oil (15.7 g, 57%). ^{1}H NMR (CDCl$_3$) δ 9.50

190

(s, 1H), 7.79-7.74 (m, 1H), 7.12 (dd, 1H, J=3.7, 1.8 Hz), 6.95 (s, 2H), 6.38 (t, 1H,

J=3.4 Hz), 2.50 (s, 6H), 2.30 (s, 3H).
(ii) 1-(2,4,6-Trimethyl-benzenesulfonyl)-1H-pyrrole-2-carbaldehyde (2.77 g, 10

5   mmol) in THF (100 ml) was treated with LiBH$_4$ (0.44 g, 20 mmol) at rt. The resulting

solution was held at rt for 1 h. MeOH (10 ml) was then added, and the resulting

mixture mixture was poured into brine (600 ml), and extracted with EtOAc (3x200

ml). The combined organic layer was dried over MgSO4 and concentrated under

reduced pressure. The resulting oil was then purified on silica gel column to yield [1-

10   (2,4,6-Trimethyl-benzenesulfonyl)-1H-pyrrol-2-yl]-methanol as a light brown oil (2.43

g, 87%). ^{1}H NMR (CDCl$_3$) δ 7.17 (dd, 1H, J=3.3, 1.8 Hz), 6.99 (s, 2H), 6.28-6.23 (m,

1H), 6.18 (t, 1H, J=3.3 Hz), 4.42 (s, 2H), 2.50 (s, 6H), 2.30 (s, 3H).
(iii) A solution of [1-(2,4,6-Trimethyl-benzenesulfonyl)-1H-pyrrol-2-yl]-methanol

15   (1.4 g, 5.0 mmol) in CHCl3 (25 ml) was cooled with an ice bath. SOCl$_2$ (1.1 ml, 15

mmol) was added slowly. The solution was allowed to warm to rt, and held an

additional 45 min. The solution was then concentrated under reduced pressure. 2-

Chloromethyl-1-(2,4,6-trimethyl-benzenesulfonyl)-1H-pyrrole was obtained as a

brown solid (1.5 g, 100%). ^{1}H NMR (CDCl$_3$) δ 7.28 (dd, 1H, J=3.3, 1.7 Hz), 6.98 (s,

20   2H), 6.38-6.34 (m, 1H), 6.19 (t, 1H, J=3.4 Hz), 4.58 (s, 2H), 2.50 (s, 6H), 2.30 (s,

15   **Example 30(e): 6-[3-((1-Ethyl-3-methyl-1H-pyrazol-5-yl)carboxamido)phenoxy]-**

3-E-stryrylindazole
Example 30(e) was prepared in a similar manner to that described for Example

30(a) using 3-(styryl-1H-indazol-6-yloxy)-phenylamine in place of 3-(3-styryl-4,5-

dihydro-1H-indazol-6-yloxy)phenylamine and 1-ethyl-3-methyl-1H-pyrazole-5-carboxylic acid in place of benzoic acid in step (ii).

Example 31(a): 6-[3-benzamidophenoxy]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole

5
To a stirred solution of 6-[3-benzamidophenoxy]-3-E-[2-(pyridin-2-yl)ethenyl]-4,5-dihydro-1H-indazole (492 mg, 1.13 mmol) in 15 mL of 1,4-dioxane was added 386 mg (1.7 mmol) 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ). The reaction mixture was stirred for 30 min at room temperature, then poured into sat

10   NaHCO$_3$ solution and EtOAc. Layers were separated and the aqueous layer was re-extracted with EtOAc. The combined organic layers were washed sequentially with sat NaHCO$_3$ solution and sat NaCl solution, dried over MgSO$_4$ and conc. under reduced pressure. The residue was flash chromatographed on silica gel eluting CH$_2$Cl$_2$/EtOAc: MeOH (1:1:0.1). The oil obtained was triturated from

15   EtOAc/hexanes to give the title compound as a tan solid (420mg, 86%). ^{1}H NMR (DMSO-d$_6$) δ 13.12 (s, 1H), 10.30 (s, 1H), 8.60 (d, 1H, J = 3.8 Hz), 8.22 (d, 1H, J = 8.8 Hz), 7.93 (m, 3H), 7.82 (t, 1H, J = 7.7 Hz), 7.68 –7.49 (m, 7H), 7.40 (t, 1H, J = 8.1 Hz), 7.27 (m, 1H), 7.08 (s, 1H), 7.03 (s,1H), 7.03 (d, 1H, J = 8.7 Hz), 6.87 (d, 1H, J = 8.1 Hz, with fine splitting). Anal. Calc for C$_{27}$H$_{20}$N$_4$O$_2$ 0.65 EtOAc : C, 72.59;

20   H, 5.19; N, 11.44. Found: C, 72.34; H, 5.11; N, 11.82.

The starting material was prepared as follows:

195

step (i)
A solution of 3-[3-(benzhydrylidene-amino)-phenoxy]-cyclohex-2-enone (4.00g, 10.9

mmol) in 20 mL of THF was added slowly to a –78 °C solution of LiHMDS (36 mL of

5   1.0M solution in THF). Fifteen minutes after addition was complete, (E)-3-pyridin-2-

yl-acryloyl chloride hydrochloride was added and stirring was continued at –78 °C for

30 min. The reaction was quenched with sat. NH$_4$Cl solution and extracted with

EtOAc (3x). The combined organic layers were washed with sat NaCl solution, dried

over MgSO$_4$ and conc. under reduced pressure. The residue was flash

10   chromatographed on silica gel eluting Hexanes/EtOAc (2:1). The appropriate

fractions were concentrated under reduced pressure and dissolved in EtOH/HOAc

(1:1, 8ml). To this solution at 80 °C was added hydrazine hydrate (3.4ml, 70.0 mmol).

After 15 min, all starting material was gone and the reaction mixture was cautiously

poured into sat. NaHCO$_3$ and extracted with EtOAc (2x). The combined organic

15   layers were washed with sat NaCl solution, dried over MgSO$_4$ and conc. under

reduced pressure. The residue was flash chromatographed on silica gel eluting

CH$_2$Cl$_2$/MeOH (9:1) to give 6-(3-aminophenoxy)-3-E-[2-(pyridin-2-yl)ethenyl]-4,5-

dihydro-1H-indazole (676mg, 19%). ^{1}H NMR (DMSO-d$_6$) δ 12.51 (s, 1H), 8.57 (d,

20   Analyzed with 0.1 H$_2$O, 0.1 EtOAc Calc'd, C (67.78), H (4.82), N (14.11), S (8.08).

Found: C (67.78), H (4.77), N (14.06), S (8.08).

The starting material was prepared as follows:

(i)
Under argon, 6-iodo-3-styryl-1-[2-(trimethyl-silanyl)-ethoxymethyl]-1H-indazole

5   (30.0 g, 62.9 mmol) prepared in Example 14, step (i), was dissolved in

dichloromethane (375 mL) and was cooled to –42 °C in an acetonitrile-dry ice bath.

Ozone was then bubbled through the mix (1 L/min, 60 V, 1.8 Amps) for 45 min.

Standard indicators did not give a clear color change due to the solutions background

color. To avoid over-oxidation, the reactions progress was monitored by TLC (1:9

10   EtOAc-Hex). The ozone addition was stopped and the flask was flushed with argon.

Dimethyl sulfide (30 mL) was then added and the mixture was allowed to warm to 23

°C. This mixture was stirred for 4h and was concentrated under reduced pressure.

The oil was placed under high vacuum for 16 h. The residue was dissolved in

dichloromethane (15 mL) and was diluted with hexane (100 mL) to give some crystals

15   (not desired product). The mixture was filtered and the filtrate was concentrated. The

residue was dissolved in 8:2 Hex-EtOAc (250 mL), treated with 50 mL silica., filtered,

and concentrated. 6-Iodo-3-carboxaldehyde-1-[2-(trimethyl-silanyl)-ethoxymethyl]-

1H-indazole formed as a yellow solid after 72 h under high vacuum (24.17 g, ~95%

pure by NMR, 91 % yield): R_f sm 0.34, p 0.29 (ethyl acetate-hexane 1:9); ^{1}H NMR

20   (300 MHz, CDCl$_3$) δ 10.25 (s, 1H), 8.09 (s, 1H), 8.05 (d, 1H), 7.80 (d, 1H), 5.88 (s,

2H), 3.71 (t, 2H), 0.93 (t, 2H), 0.0 (s, 9H).

(ii)
6-Iodo-3-carboxaldehyde-1-[2-(trimethyl-silanly)-ethoxymethyl]-1H-indazole (24.0 g,

59.7 mmol) was dissolved in THF (350 mL) and was cooled to –5 °C. To this was

5   added solid 2-picolyltriphenylphosphonium chloride-potassium hydride (45.7 g, 100

mmol, 1.68 equiv). The reaction mixture was allowed to stir for 45 min. To the

mixture, was added 3N HCl (20 mL) followed by saturated aqueous sodium

bicarbonate (50 mL) to give a pH of 6. Excess THF was removed under reduced

pressure and the residue was partitioned between ethyl acetate and water. The

10   organics were washed with saturated aqueous sodium bicarbonate, water and the

organic layer was separated, dried over sodium sulfate, decanted and concentrated

under reduced pressure. The residue was taken up in 1:9 ethyl acetate-hexane and was

filtered. The filtrate was purified by silica gel chromatography (2L silica, 20 to 30 to

50 % ethyl acetate-hexane) to give 6-Iodo-3-E-[2-(pyridin-2-yl)ethenyl-1-[2-

15   (trimethyl-silanly)-ethoxymethyl]-1H-indazole (18.9 g, 66% yield): R_f sm 0.52, p

Example 35(a): 6-[2-(n-Propylcarbamoyl)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole
15   6-[2-(Pentafluorophenoxycarbonyl)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H–indazole (60 mg, 0.1112 mmol) was dissolved in DMF (0.8 mL), treated with n-propylamine (11 μL, 0.1335 mmol) and stirred at room temperature. HPLC analysis after 15 minutes indicated that all staring material had been consumed.

The reaction mixture was concentrated by high vacuum rotary evaporation, giving a solid. The solid was sonicated with CH_2Cl_2 giving a fine suspension, which was filtered, and rinsed with CH_2Cl_2 to provide 40 mg (87% yield) of the title compound.

^{1}H NMR (DMSO-d_6) δ 13.31 (s, 1H), 8.60 (d, J = 4.0 Hz, 1H), 8.41 (t, J = 6.2 Hz,

5   1H), 8.19 (d, J = 8.5 Hz, 1H), 7.94 (m, 3H), 7.81 (dt, J = 1.7, 7.5 Hz, 1H), 7.66 (t, J = 8.7 Hz, 1H), 7.56 (m, 2H), 7.47 (m, 1H), 7.30 (m, 3H), 7.18 (d, J = 8.3 Hz, 1H), 3.20 (q, J = 6.0 Hz, 2H), 1.55 (septet, J = 5.9 Hz, 2H), 0.92 (t, J = 6.0 Hz, 3H). Anal. Calcd. for $C_{24}H_{22}N_4OS \cdot (1.5\ H_2O, 0.8\ DMF)$: C, 63.41; H, 6.17; N, 13.45; S, 6.41. Found: C, 63.37; H, 5.68; N, 13.44; S, 6.32.

10   The starting material was prepared as follows:
A solution of the tetrabutyl ammonium salt of 6-(2-carboxyphenylsulfanyl)-3-E-[2-(pyridin-2-yl)ethenyl]-1H—indazole) (615 mg, 1.0 mmol) dissolved in dry DMF (10.0 ml) was treated with pyridine (89 μL, 1.1 mmol), and pentafluorophenyl

15   trifluoroacetate (206 μL, 1.2 eq), at room temperature, under an argon atmosphere. HPLC analysis after 45 minutes showed mostly unreacted carboxylic acid, so additional pyridine (89 μL, 1.1 mmol), and pentafluorophenyl trifluoroacetate (206 μL, 1.2 eq) were added. HPLC analysis 15 minutes later indicated that starting acid had been completely consumed. The reaction mixture was concentrated under high

20   vacuum rotary evaporation, then triturated with CH_2Cl_2 (~1mL) causing the formation

of crystals, which were collected by filtration, rinsed with additional CH_2Cl_2, and

dried. The mass of the bright yellow crystals was 336 mg. The remaining filtrate was

concentrated and purified by flash chromatography (10% acetontrile/CH_2Cl_2 to 80%

acetonitrile/CH_2Cl_2), yielding an additional 70 mg of solid. The total yield of 6-[2-

5   (Pentafluorophenoxycarbonyl)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H--

indazole was 406 mg, or 89%. ^{1}H NMR (CDCl$_3$) δ 10.22 (1H, bs), 8.66 (1H, d, J =

4.5 Hz), 8.28 (2H, dd, J = 7.7. 1.5 Hz), 8.15 (1H, d, J = 8.5 Hz), 7.97 (1H, d, J = 16.2

Example 35(j): 6-[2-(Allyloxycarbamoyl)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole
Example 35(j) was prepared in a similar manner to that described for Example 35(a) except that O-allyl hydroxylamine was used instead of n-propylamine. ^{1}H NMR (DMSO-d_6) δ 13.32 (s, 1H), 11.56 (s, 1H), 8.60 (d, J = 4.1 Hz, 1H), 8.19 (d, J = 8.3 Hz, 1H), 7.95 (d, J = 16.5 Hz, 1H), 7.81 (dt, J = 1.7, 7.5 Hz, 1H), 7.66 (d, J = 7.9 Hz, 1H), 7.56 (m, 2H), 7.48-7.24 (m, 5H), 7.16 (m, 2H), 6.00 (m, 1H), 5.37 (d, J = 18.3 Hz, 1H), 5.27 (d, J = 11.3 Hz, 1H), 4.42 (d, J = 6.0 Hz, 1H). Anal. Calcd. for $C_{24}H_{20}N_4O_2S$·(0.2 H_2O, 0.2CH_2Cl_2): C, 65.35; H, 4.96; N, 12.10; S, 6.92. Found: C, 65.24; H, 4.50; N, 12.56; S, 7.17.

Example 35(k): 6-[2-(Isopropoxycarbamoyl)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole
Example 35(k) was prepared in a similar manner to that described for Example 35(a) except that O-isopropyl hydroxylamine was used instead of n-propylamine. ^{1}H NMR (DMSO-d_6) δ 13.30 (s, 1H), 11.33 (s, 1H), 8.60 (d, J = 4.1 Hz, 1H), 8.19 (d, J = 8.3 Hz, 1H), 7.95 (d, J = 16.5 Hz, 1H), 7.81 (dt, J = 1.7, 7.5 Hz, 1H), 7.66 (d, J = 7.9

Hz, 1H), 7.55 (m, 2H), 7.48-7.24 (m, 4H), 7.17 (d, J = 8.3 Hz, 2H), 4.12 (septet, J =

5.7 Hz, 1H), 1.21 (d, J = 6.2 Hz, 6H. Anal. Calcd. for $C_{24}H_{22}N_4O_2S\cdot(0.4\ H_2O, 0.7$

$CH_2Cl_2)$: C, 59.67; H, 4.91; N, 11.27; S, 6.45. Found: C, 59.61; H, 4.81; N, 11.42; S,

6.45.

5   Example 35(l): 6-[2-((4-Aminobenzyl)methylcarbamoyl)phenylsulfanyl]-3-E-[2-

(pyridin-2-yl)ethenyl]-1H-indazole
Example 35(l) was prepared in a similar manner to that described for Example

35(a) except that 4-aminobenzyl amine was used instead of n-propylamine. ^{1}H NMR

10   (DMSO-d$_6$) δ 13.31 (s, 1H), 8.78 (t, J = 6.0 Hz, 1H), 8.60 (d, J = 4.3 Hz, 1H), 8.19 (d,

J = 8.1 Hz, 1H), 7.95 (d, J = 16.3 Hz, 1H), 7.85 (bs, 1H), 7.81 (dt, J = 1.7, 7.5 Hz,

1H), 7.66 (d, J = 7.9 Hz, 1H), 7.59 (s, 1H), 7.51 (m, 2H), 7.30 (m, 3H), 7.19 (d, J =

8.7 Hz, 1H), 7.05 (m, 3H), 6.56 (d, J = 8.7 Hz, 1H), 6.51 (d, J = 8.5 Hz, 2H), 4.29 (d,

J = 6.0 Hz, 2H). Anal. Calcd. for $C_{28}H_{23}N_5OS\cdot0.6\ H_2O$: C, 68.86; H, 4.99; N, 14.34;

15   S, 6.57. Found: C, 68.83; H, 4.80; N, 14.16; S, 6.52.

Example 35(m): 6-[2-((Thien-2-ylhydrazido)carbonyl)phenylsulfanyl]-3-E-[2-

(pyridin-2-yl)ethenyl]-1H-indazole
Example 35(m) was prepared in a similar manner to that described for

Example 35(a) except that thien-2-ylhydrazide was used instead of n-propylamine. ^{1}H

NMR (DMSO-d$_6$) δ 13.49 (bs, 1H), 10.64 (s, 1H), 10.47 (s, 1H), 8.66 (d, J = 4.0 Hz,

5   1H), 8.22 (d, J = 8.5 Hz, 1H), 8.08-7.82 (m, 5H), 7.66 (m, 3H), 7.39 (m, 3H), 7.24

(m, 2H), 7.09 (d, J = 8.1 Hz, 1H), 7.00 (d, J = 3.4 Hz, 2H), 6.07 (t, J = 3.2 Hz, 1H),

3.88 (s, 3H). Anal. Calcd. for $C_{26}H_{19}N_5O_2S_2$·1.5 H$_2$O: C, 59.52; H, 4.23; N, 13.35; S,

12.22. Found: C, 59.56; H, 4.42; N, 13.33; S, 11.75.

Example 35(n): 6-[2-(N^2-(pyrid-2-ylhydrazino)carbonyl)phenylsulfanyl]-3-E-[2-

10   **(pyridin-2-yl)ethenyl]-1H-indazole**
Example 35(n) was prepared in a similar manner to that described for Example

35(a) except that 2-hydrazinopyridine was used instead of n-propylamine. ^{1}H NMR

(DMSO-d$_6$) δ 13.31 (s, 1H), 10.30 (s, 1H), 8.60 (d, J = 4.4 Hz, 1H), 8.48 (s, 1H), 8.21

Example 39(a): 6-[2-(Methylcarbamoyl)phenylamino]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole

5
A solution of N-methyl-2-[3-((E)-2-pyridin-2-yl-vinyl)-1-(2-trimethylsilanyl-

ethoxymethyl)-1H-indazol-6-ylamino]-benzamide (39 mg, 0.07820 mmol) (synthesis

described below), ethylene diamine (21 μL, 0.3128 mmol), and 1M TBAF in THF

(0.63 ml, 0.6256 mmol), was stirred in a 90 °C oil bath for 2 hr. The crude reaction

10   mixture was diluted with ethyl acetate (50 mL), extracted 1M sodium bicarbonate

solution (2 x 20 ml), brine (5 x 20 ml), dried magnesium sulfate, filtered, and

concentrated to a solid. The solid was dissolved in THF, concentrated to an oil, then

triturated with CH$_2$Cl$_2$/Et$_2$O, causing precipitation of a powder. The powder was

collected by filtration, rinsed with Et$_2$O, and dried under high vacuum. Mass of

15   collected solid was 20 mg (70 % yield). ^{1}H NMR (DMSO-d$_6$) δ 12.91 (bs, 1H), 9.86

(s, 1H), 8.60 (d, J = 4.0 Hz, 1H), 8.52 (m, 1H), 8.08 (d, J = 8.5 Hz, 1H), 7.90 (d, J =

Hz, 1H), 7.47-7.34 (m, 2H), 7.25 (m, 2H), 7.00 (d, J = 9.6 Hz, 1H), 6.89 (t, J = 7.0

Hz, 1H), 2.79 (d, J = 4.7 Hz, 3H). Anal. Calcd. for C$_{22}$H$_{19}$N$_5$O·0.5 CH$_2$Cl$_2$: C, 65.61;

20   H, 4.89; N, 17.00. Found: C, 65.52; H, 5.08; N, 16.78.

The starting material was prepared as follows:

(i)
.A solution of 191 mg (0.4 mmol) of 6-iodo-3-carboxaldehyde-1-[2-(trimethyl-

silanly)-ethoxymethyl]-1H-indazole (from Example 33(a), step(ii)), methyl

5   anthranilate (120.1 mg, 0.8 mmol), 2-(dicyclohexylphosphino) biphenyl (28 mg,0.08

mmol), Pd$_2$(dba)$_3$ (18.4 mg, 0.02 mmol), K$_3$PO$_4$ (212.3 mg, 1.0 mmol), dissolved in

dry DME (1.0 mL), was vacuum flushed with argon (3X), then stirred under an argon

atmosphere for 3d in an oil bath at 80 °C. The crude mixture was filtered through a

plug of SiO$_2$ eluted with ethyl acetate, then purified by "chromatotron" radial

10   chromatography eluted with 25% CH$_3$CN/CH$_2$Cl$_2$. The mass of the fractions that

were pure was 42 mg. An addition 120 mg of product that was ~90% pure was also

collected. The total yield of N-methyl-2-[3-((E)-2-pyridin-2-yl-vinyl)-1-(2-

trimethylsilanyl-ethoxymethyl)-1H-indazol-6-ylamino]-benzamide was 162 mg or

~81%.

15   **Example 39(b): 6-[2-(Prop-2-ynylcarbamoyl)phenylamino]-3-E-[2-(pyridin-2-**

Example 40(a): 6-(3-Amino-benzoyl)-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole

10
Example 40(a) was prepared in a similar manner to that described for Example

11. ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 13.5 (s, 1H), 8.62 (d, 1H, J = 3.86 Hz), 8.34 (d,

1H, J = 8.5 Hz), 8.01 (d, 1H, J = 16.36 Hz), 7.87 (s, 1H), 7.83 (td, 1H, J = 7.69 Hz, J

= 1.81 Hz), 7.58-7.71 (m, 3H), 7.29 (qd, 1H, J = 7.39 Hz, J = 0.98 Hz), 7.21 (t, 1H, J

15   = 7.77), 7.00 (t, 1H, J = 1.86 Hz), 6.90 (dt, 1H, J = 6.15 Hz, J = 1.40 Hz), 6.86 (m,

1H), 5.40 (bs, 2H). MS (ESI+) [M+H]/z Calc'd 446, found 446. Calc'd: C, 74.10;

H, 4.74; N, 16.46. Found: C, 72.72; H, 4.87; N, 16.02.

The starting material was prepared as follows:

(i)
To m-amino-phenyl boronic acid (8.22g, 60 mmol) in dimethyformamide (60 ml) at

23 °C under an atmosphere of argon was added triethylamine (10 ml, 72 mmol) and 4-

(dimethylamino)pyridine (0.366 g, 3 mmol). The resulting solution was heated to 50

5   °C. Carbonic acid 4-nitro-phenyl ester 2-trimethylsilanyl-ethyl ester (20.4 g, 72 mmol)

-was added in 5 by 4g portions over 18 hours. After 44 h carbonic acid 4-nitro-phenyl

ester 2-trimethylsilanyl-ethyl ester (3.4 g, 12 mmol) was added followed by

triethylamine (1.7 ml, 12 mmol). After 63 h the reaction mixture was concentrated to

an oil. Purification by silica gel chromatography eluting with 3-7 to 7-3 ethyl acetate-

10   hexane gave (3-boronic acid-phenyl)-carbamic acid 2-trimethylsilanyl-ethyl ester

(8.12 g, 48%): R_f sm 0.067, p 0.33 (ethyl acetate-hexane 1:1); ^{1}H NMR (300 MHz,

CD$_3$OD) δ 7.64 (s, 1H), 7.49 (d, 1H, J = 8.94 Hz), 7.26 (m, 2H), 4.23 (t, 2H, J = 8.28

Hz), 1.06 (t, 2H, J = 8.21 Hz) 0.72 (s, 9H). MS (ESI) [M+Na]/z Calc'd 304, found

304.

15   (ii)
A mixture of 6-iodo-3-((E)-2-pyridin-2-yl-vinyl)-1-(2-trimethylsilanyl-ethoxymethyl)-

1H-indazole (7.1 g, 14.8 mmol), (3-boronic acid-phenyl)-carbamic acid 2-

trimethylsilanyl-ethyl ester (8.32 g, 29.6 mmol), dichlorobis(triphenylphosphine)-

247

palladium(II) (312 mg, 0.44 mmol), potassium carbonate (6.13 g, 44.4 mmol) and

triethylamine (2.1 ml, 14.8) in anisole (60 ml) was heated to 80 °C under an

atmosphere of carbon monoxide. After 24 h more triethylamine (2.1 ml, 14.8 mmol)

was added. After 33 hrs the reaction was determined to be complete by TLC analysis

5   (ethyl acetate-hexane 7-3). The reaction mixture was cooled to 23 °C, then diluted

with saturated NaHCO$_3$ (aq) (40 ml) and ethyl acetate (300 ml). The phases were

separated and the aqueous was extracted with ethyl acetate (2 x 100 mls). The pooled

ethyl acetate was washed with brine (100 ml) and dried over Na$_2$SO$_4$, filtered and

concentrated. Purification by silica gel chromatography gave (3-{1-[3-(2-Pyridin-2-yl-

10   ethyl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-yl]-methanoyl}-phenyl)-

carbamic acid 2-trimethylsilanyl-ethyl ester as a yellow glass (7.22 g, 79%). ^{1}H NMR

(300 MHz, CDCl$_3$) δ 8.65 (d, 1H, J = 3.93 Hz), 8.10 (d, 1H, J = 8.54 Hz), 8.04 (s,

C, 74.56; H, 5.12; N, 15.81. Found: C, 73.86; H, 5.25; N, 15.34.

The starting material was prepared as follows:

(i)
10

A mixture of 4-methyl-3-nitro-phenyl boronic acid (3.34 g, 18.45 mmol) and 10%

Pd/C (334 mg) in MeOH (30 ml) was hydrogenated (1 atm.) at 23 °C. After 22 h the

reaction mixture was filtered through celite and concentrated to give 3-amino-4-

methyl phenyl boronic acid (2.53 g, 91%). ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 7.21 (s,

15   1H), 7.08 (d, 1H, J = 7.5 Hz), 6.92 (d, 1H, J = 7.46 Hz), 4.81 (bs, 2H), 2.09 (s, 3H).

MS (ESI) [M+H]/z Calc'd 152, found 152.

Example 40(c): 6-(5-Amino-2,4-dimethyl-benzoyl)-3-E-[2-(pyridin-2-yl)ethenyl]-

1H-indazole
Example 40(c) was prepared in a similar manner to that of Example 40(a) except that

in step (i) 2,4-dimethyl-3-amino-phenyl boronic acid (prepared as described below)

was used in place of m-amino-phenyl boronic acid: ^{1}H NMR (DMSO-d$_6$) δ 8.62 (d,

1H, J = 3.78 Hz), 8.32 (d, 1H, J = 8.48 Hz), 7.99 (d, 1H, J = 16.35 Hz), 7.83 (td, 1H, J

5   = 7.68 Hz, J = 1.8 Hz), 7.80 (s, 1H), 7.69 (d, 1H, J = 7.80 Hz), 7.64 (dd, 1H, J = 8.47

Hz, J = 1.27 Hz), 7.62 (d, 1H, J = 16.36 Hz), 7.29 (m, 1H), 6.94 (s, 1H), 6.64 (s, 1H),

4.87 (bs, 2H), 2.12 (s, 3H), 2.10 (s, 3H). LCMS (ESI+) [M+H]/z Calc'd 369, found

369. Anal. Calc'd: C, 74.98; H, 5.47; N, 15.21. Found: C, 73.85; H, 5.56; N, 14.49.

The starting material was prepared as follows:

10   (i)
2,4-Diemthylphenyl boronic acid was made in a similar manner as that of Example

24(a), step (vii), except 2,4-dimethyl bromobenzene was used as starting material. ^{1}H

NMR (CD$_3$OD) δ 7.13 (d, 1H, J = 7.43 Hz), 7.00 (s, 1H), 6.97 (d, 1H, J = 7.49 Hz),

15   2.28 (s, 3H), 2.28 (s, 3H). LCMS (ESI+) [M+H]/z Calc'd 151, found 151.

(ii)
To fuming nitric acid (1 ml) cooled to –40 °C was added TFA (1 ml). The resulting

mixture was allowed to warm slightly to –35 °C and 2,4-dimethyl phenyl boronic acid

20   (150 mg, 1 mmol) was added in one portion. After 1 h, ice was added and the

250

heterogenous mixture was filtered. The resulting solid was suspended in Et₂O and

extracted with 3N NaOH (aq) (1 ml) then water (2 ml). The aqueous phase was

acidified with 3N HCl (aq) (1 ml) and back extracted with EtOAc (3 x 5 ml). The

pooled organics were washed with brine, dried with Na₂SO₄ decanted and

5   concentrated to give 2,4-dimethyl-5-nitro-phenyl boronic acid (93 mg, 47%). LCMS

(ESI+) [M+H]/z Calc'd 196, found 196.

(iii)
3-Amino-4,6-dimethylphenyl boronic acid was prepared in a similar as that described

10   for Example 40(b), step (i). ^{1}H NMR (CD₃OD) δ 6.83 (s, 2H), 6.64 (s, 1H), 2.17 (s,

3H), 2.13 (s, 3H).

Example 41(a): 6-[3-((1-Ethyl-3-methyl-1H-pyrazol-5-yl)carboxamido)benzoyl]-

3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole
15   To a solution of 2-ethyl-5-methyl-2H-pyrazole-3-carboxylic acid (323 mg, 2.1

mmol, 2.1 equiv.) in DMF (5 ml) at 23 °C under argon was added

diisopropylethylamine (365 μl, 2.1 mmol, 2.1 equiv.), HATU (798 mg, 2.1 mmol, 2.1

equiv.) and DMAP (cat.). To the resulting solution was added 6-(3-Amino-benzoyl)-3-

E-(2-pyridin-2-yl)ethenyl)-1H-indazol (Example 40(a), 340 mg, 1 mmol, 1 equiv.).

The reaction was followed by HPLC until all the starting analine was consumed ~2 h

(this gave a mixture of mono and bis acylated compounds). The reaction mixture was

quenched with saturated NaHCO₃, then diluted with water and extracted with

ethylacetate. The pooled EtOAc was washed with water, brine, dried with Na₂SO₄,

5   filtered and concentrated to an oil. The oil was dissolved in methanol (10 ml), K₂CO₃

(290 mg, 2.1 mmol, 2.1 equiv.) was added and the resulting mixture was stirred at 23

°C until the bis-acylated compound was consumed (~30 min.). The reaction mixture

was concentrated to an oil, then partitioned between water and EtOAc. The organic

phase was washed with brine, dried with Na₂SO₄, filtered and concentrated.

10   Purification by silica gel chromatography (1:1-8:2 ethylacetate-dichloromethane) gave

Example 41(a). ¹H NMR (300 MHz, DMSO-d₆) δ 13.6 (s, 1H), 10.3 (s, 1H), 8.62 (d,

1H, J = 3.88 Hz), 8.38 (d, 1H, J = 8.51 Hz), 8.20 (s, 1H), 8.12 (td, 1H, J = 7.58 Hz, J

Example 42(a) was prepared from 6-(3-benzamidobenzoyl)-3-E-[2-(pyridin-2-yl)ethenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole in a similar manner as

10 that of Example 12. (0.58 g, 80.6%). HPLC 4.13 min (98% area). ^{1}H NMR (CDCl$_3$)

δ 8.66 (d, 1H, J = 4.1 Hz), 8.24 (d, 1H, J = 8.5Hz), 8.11-8.10 (m, 3H), 8.01-7.98 (m,

4H), 7.83 (t, 2H, J = 7.1Hz), 7.72-7.53 (m, 7H), 7.30 (qd, 1H, J = 5.2, 1.1Hz). HRMS

(MALDI) C$_{28}$H$_{20}$N$_4$O$_2$. [M + H$^+$]/z: Calc. 445.1664, found 445.1659. Anal.

(C$_{26}$H$_{19}$N$_5$O$_2$•0.2EtOAc): C, 75.87; H, 4.78; N, 12.39.

15 The starting material was prepared as follows:

(i)
To a stirred solution of 6-iodo-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-

indazole (4.00 g, 8.40 mmol), from Example 14 step (i), in anisole (48 mL) under an

5   argon atmosphere were added bis(triphenylphosphine)palladium dichloride (176 mg,

0.25 mmol), TBACl (288 mg, 1.0 mmol), 2-butanol (1.54 mL, 16.8 mmol) and

potassium carbonate (3.48 g, 25.2 mmol). The resulting mixture was stirred under a

carbon monoxide atmosphere at 80 °C for 100 h. After removal of the solvent by *in*

vacuo concentration, the residue obtained was diluted with EtOAc (400 mL) and

10   extracted with sat. NaCl (2 x 150 mL), sat. NaHCO$_3$ (2 x 50 mL) and water (2 x 50

mL) then organic layer filter through 20 mL of silica. The organic filtrate was then

concentrated *in vacuo*, to give an amber oil. Purification by flash chromatography

with hexane:EtOAc (7:3) provided 6-(3-aminobenzoyl)-3-((E)-styryl)-1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-indazole as an amber oil upon concentration (2.38

15   g, 61% yield). ^{1}H NMR (CDCl$_3$) δ 8.84 (dd, 1H, J = 8.70, 0.90 Hz), 8.02 (s, 1H),

7.77 (dd, 1H, J = 8.40, 1.50Hz), 7.62-7.59 (m, 2H), 7.40 (t, 2H, J = 7.20Hz), 7.38-

7.24 (m, 4H), 7.22-7.19 (m, 3H), 6.98 (dq, 1H, J = 8.30, 0.90Hz), 3.83 (brs, 2H,),

3.61 (t, 2H, J = 8.10Hz), 0.91 (t, 2H, J = 7.20Hz), -0.17 (s, 9H).

(ii)
To a stirred solution of 6-(3-aminobenzoyl)-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole (3.22 g, 6.87 mmol) in methylene chloride (10 mL) under an argon atmosphere was added benzoyl chloride (0.95 mL, 8.37 mmol) and pyridine

5   (0.67 mL, 3.22 mmol). After 2 h the solution was diluted with 100 mL of EtOAc and washed with saturated NaCl (1 x 50 mL), citric acid (1M, 2.5 pH, 2 x 50 mL) and (50:50) NaHCO$_3$/water (2 x 50 mL). The organic layer was dried over Na$_2$SO$_4$ and filtered through 20 mL of silica. The organic layer was concentrated *in vacuo*, to provide the product as a yellow solid. Purification using flash chromatography

10   through silica eluting with hexane:EtOAc (7:3) afforded 6-(3-benzamidobenzoyl)-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole as a yellow foam (3.22 g, 85.1% yield). ^{1}H NMR (CDCl$_3$) δ 8.19 (d, 1H, J = 8.7Hz), 8.16 (s, 1H,), 8.11-8.10 (m, 2H), 8.03-7.93 (m, 3H), 7.82(dd, 1H, J = 8.4, 1.2Hz), 7.70-7.67 (m, 3H), 7.64-7.54 (m, 5H), 7.48 (t, 2H, J = 14.1Hz) 7.39 (1H, d, J = 7.2Hz).

15   (iii)
A stirred solution of 6-(3-benzamidobenzoyl)-3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxy-methyl)-1H-indazole (2.35g, 4.07 mmol) in methylene chloride (45.6 mL) was cooled to –45 °C using acetonitrile/solid carbon dioxide bath. Ozone was then

282

bubbled through the solution at a rate of 1.5 Lpm, 60 amps for 15 minutes. The

reaction mixture was quenched with the addition of hydrogen sulfide (2.5 mL) and

warmed to 25 °C. Removal of methylene chloride was accomplished by *in vacuo*

concentration. The residue was purified through silica eluting with hexane:EtOAc

5   (7:3) afforded 6-(3-benzamidobenzoyl)-1-(2-trimethylsilanyl-ethoxy-methyl)-1*H*-

indazole-3-carboxaldehyde as an off-white foam (1.74g, 85% yield). HPLC. 3.78 min

(100% area); ^{1}H NMR (DMSO-d$_6$) δ 10.77 (s, 1H), 10.42 (s, 1H), 8.46-8.39 (m, 2H),

8.31 (dt, 1H, J = 6.0, 1.8 Hz), 8.19 (s, 1H,), 8.11-8.07 (m, 2H,), 7.91 (dd, 1H, J = 6.0,

1.2Hz), 7.70-7.64 (m, 5H), 5.81 (s, 2H) 3.68 (t, 2H, J = 6.9Hz), 0.98 (t, 2H, J =

10 6.7Hz), 0.02 (s, 9H).

(iv)
To a stirred solution of 2-picolytriphenyphosphonium chloride w/sodium hydride

(2.23g, 4.91mmol) cooled to –78 °C was added 6-(3-benzamidobenzoyl)-1-(2-

15 trimethylsilanyl-ethoxy-methyl)-1*H*-indazole-3-carboxaldehyde (1.26g, 2.46 mmol) in

5 mL of THF anhydrous under an argon purge and stirred for 1h at 0 °C and quenched

via CH$_3$COOH/MeOH (1:1, 1mL). The reaction mixture was diluted with 100 mL of

EtOAc and partitioned between saturated NaCl (1 x 50 mL), and saturated NaHCO$_3$ (2

x 50 mL) then the organic layer dried over Na$_2$SO$_4$ and filter through 20 mL of silica

20 plug (3:1 trans/cis mixture). Purification with a 4 mm silica rotor eluting with

hexane/EtOAc (1:1) afford 6-(3-benzamidobenzoyl)-3-E-[2-(pyridin-2-yl)ethenyl]-1-

(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole after concentration as a yellow solid

(1.05g, 62%). ^{1}H NMR (CDCl$_3$) δ 8.62 (d, 1H, J = 4.1 Hz), 8.22 (d, 1H, J = 8.5Hz),

8.11-8.10 (m, 3H), 8.01-7.98 (m, 4H), 7.83 (t, 2H, J = 7.1Hz), 7.72-7.53 (m, 7H),

7.30 (qd, 1H, J = 5.2, 1.1Hz), 5.81 (s, 2H) 3.68 (t, 2H, J = 6.9Hz), 0.98 (t, 2H, J =

5   6.7Hz), 0.02 (s, 9H).

Example 42(b): 6-(3-Benzamidobenzoyl)-3-(1H-benzoimidazol-2-yl)-1H-indazole
Example 42(b) was prepared in a similar manner to that described for

Example 42(a) except that step (iv) was replaced by the following: To the

10   aldehyde prepared in Example 42(a), step (iii) was added 1,2-diaminobenzene

(0.011 g, 011 mmol), elemental sulfur (USP grade, 0.4g, 0.1201 mmol), 2 mL of

anhydrous DMF and the mix was warmed to 90 °C for 18h, cooled to 25 °C The

reaction mixture was diluted with 10 mL of ethyl acetate and was washed with

saturated NaCl (1 X 10 mL), NaHCO$_3$ (1 X 10 Ml) and water 10 mL, dried over

15   NaSO$_4$ and filter though a teflon filter 0.22 μM and concentrated to a amber oil.

Purification by radial chromatography followed by precipitation from 2 mL of

methylene chloride and hexane (2 mL) afforded intermediate as a white

precipitated. ^{1}H NMR (Acetone-d6) δ 8.81 (d, 1H, J = 8.6), 8.30-8.25 (m, 2H),

8.11 (s, 1H), 8.02-7.99(m, 2H), 7.79 (td, 2H, J = 12.2, 1.2Hz), 7.63-7.47 (m, 7H),

5   73.25; H, 4.63; N, 11.39. Found: C, 73.10; H, 4.58; N, 11.28.

Starting material was prepared as follows:

(i)
6-(3-Benzamidobenzoyl)-1-(2-trimethylsilanyl-ethoxy-methyl)-1H-indazole-3-

10   carboxaldehyde (prepared in Example 42(a), step (iii)) was converted to 6-(3-

benzamidobenzoyl)-3-E-(2-nitrophenyl)ethenyl-1-(2-trimethylsilanyl-ethoxymethyl)-

1H-indazole in similar manner to that of Example 42(a), step (iv) except that (2-

nitrobenzyl)triphenylphosphonium bromide monohydrate was used in place 2-

picolytriphenyphosphonium chloride (0.19 g, 79%). ^{1}H NMR (CDCl$_3$) δ 8.15-7.93

15   (m, 5H), 7.89-7.86 (m, 3H), 7.54-7.41 (m, 6H), 7.36-7.35 (m, 2H), 7.21-7.18 (m, 2H),

7.03-6.91 (m, 1H), 3.64-3.46 (m, 2H), 0.96-0.79 (m, 2H), -0.06 (s, 9H).

(ii)
6-(3-Benzamidobenzoyl)-3-E-(2-nitrophenyl)ethenyl-1-(2-trimethylsilanyl-

ethoxymethyl)-1*H*-indazole (0.19, 0.32 mmol) was dissolved in 3 mL of DMF, treated

with $SnCl_2$ (0.26g, 1.40 mmol) and water (0.037 mL, 1.87 mmol), and was stirred for

3h at 50 °C. The reaction was quenched at 25 °C with 0.5 mL of 3N NaOH and the

5   precipitate was removed by filtration through celite. The solution was then partitioned

between 50/50 saturated $NaHCO_3$/water (2 x 30 mL) and the organic layer was filtered

through a silica plug to give 6-(3-benzamidobenzoyl)-3-E-(2-aminophenyl)ethenyl-1-

(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole as an amber oil (0.17 g, 92 %).

Product was used without further purification.

10   (iii)
6-(3-Benzamidobenzoyl)-3-E-(2-aminophenyl)ethenyl-1-(2-trimethylsilanyl-

ethoxymethyl)-1*H*-indazole (0.17, 0.28 mmol) was dissolved in 3 mL of methylene

chloride. To this was added formic acid pentafluorophenyl ester (0.12g, 0.56 mmol)

15   dropwise. After 3h, the reaction mixture was diluted with 40 mL of EtOAc and was

washed with 50/50 $NaHCO_3$ (2 x 30 mL) and the organic layer was filtered through a

silica plug. The residue was purified by radial chromatography through silica eluting

with hexane:EtOAc/CH_2Cl_2 (1:1:1) which afforded 6-(3-benzamidobenzoyl)-3-E-(2-

formamidophenyl)ethenyl-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole as a clear

20   oil (63 mg, 40%). ^{1}H NMR ($CDCl_3$) δ 8.48-8.36 (m, 1H), 8.20-7.84 (m, 4H), 7.61-

7.52 (m, 5H), 7.41-7.32 (m, 4H), 7.26-7.01 (m, 4H), 6.82 (t, 1H, J = 14.2Hz), 3.48-

3.23 (m, 2H), 0.95-0.87 (m, 2H), -0.05 (s, 9H).

Example 44: 6-(3-Aminobenzoyl)-3-E-[N-(pyrrol-1-yl)iminomethyl]-1H-indazole
5   Example 44 was prepared from the starting material described below in a

similar manner to that described for Example 12. R_f sm 0.6, p 0.5 (ethyl acetate): ^{1}H

NMR (300 MHz, CDCl$_3$) δ 8.8 (s, 1H), 8.5 (d, 1H), 7.95 (s, 1H), 7.75 (d, 1H), 7.45-

7.3 (m, 7H), 7.2 (m, 1H), 6.40 (s, 2H).

The starting material was prepared as follows:

10   (i)
Aldehyde prepared in Example 33(a), step (i) (204 mg, 0.507 mmol) and 1-

aminopyrrole (67 μL, 0.66 mmol, 1.3 equiv) were stirred together in toluene (2 mL).

To this mix was added PPTS (1 mg) and the solution was heated to 80 °C for 1h. The

15   mixture was cooled and was partitioned between 2:8 ethyl acetate-hexane and water.

The organic material was dried over sodium sulfate, decanted and concentrated under

reduced pressure. The product was crystallized from dichloromethane (0.5 mL) and

methanol (2 mL) (215.7 mg, 91%): ^{1}H NMR (300 MHz, C$_6$D$_6$) δ 8.71 (s, 1H), 8.25 (d,

1H, J = 8.5 Hz), 8.08 (s, 1H), 7.75 (d, 1H, J = 8.5 Hz), 6.35 (s, 2H), 5.85 (s, 2H).

(ii)
A mixture of the above iodide (535 mg, 1.15 mmol, 1 equiv), 3-aminophenyl boronic

acid (236 mg, 1.72 mmol, 1.5 equiv), PdCl$_2$(PPh$_3$)$_2$ (24 mg, 0.034 mg, 0.03 equiv),

5   and potassium carbonate were taken up in anisole (6.7 mL) under carbon monoxide (1

atm). The mixture was heated to 80 °C for 14 h. The mix was cooled, partitioned

between ethyl acetate and water. The organics were washed with saturated aqueous

sodium bicarbonate, water and brine and the organic layer was separated. The organic

material was dried over sodium sulfate, decanted and concentrated under reduced

10   pressure. Purification by silica gel chromatography (50 mL silica: 2:8 to 3:7 ethyl

acetate-hexane) gave product aniline as a solid (331 mg, 63%): R$_f$ sm 0.60, p 0.21

(ethyl acetate-hexane 3:7); ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.75 (s, 1H), 8.51 (d, 1H, J

= 8.4 Hz), 8.06 (s, 1H), 7.76 (dd, 1H, J = 1.3, 8.4 Hz), 7.26 (m, 3H), 7.17 (m, 2H),

6.92 (m, 1H), 6.31 (t, 1H, J = 2.3 Hz), 5.79 (s, 2H), 3.84 (bs, 2H), 3.60 (t, 2H, J = 8.2

15   Hz), 0.91 (t, 2H, J = 8.2 Hz), -.08 (s, 9H). LCMS 4.98 min (pos) [M+H]/z Calc'd 460,

found 460.

Example 45(a): 6-[3-(Indol-4-ylcarboxamido)benzoyl]-3-E-[N-(pyrrol-1-

yl)iminomethyl]-1H-indazole
Example 45(a) was prepared from Example 44 in a similar manner to that described for Example 12(d), except that indole-4-carboxylic acid was used instead of 5-methyl-thiazole-2-carboxylic acid: R_f sm 0.0, p 0.2 (ethyl acetate-benzene 1:3); ^{1}H NMR (300 MHz, dmso-d6) δ 9.84 (s, 1H), 8.92 (s, 1H), 8.66 (s, 1H), 8.39 (d, 1H, J=8.5 Hz), 8.02 (s, 1H), 7.86 (m, 2H), 7.66 (d, 1H, J=8.5 Hz), 7.52-7.40 (m, 4H), 7.27-7.07 (m, 5H), 6.83 (s, 1H), 6.21 (s, 2H).

Example 45(b): 6-(3-Benzamidobenzoyl)-3-E-[N-(pyrrol-1-yl)iminomethyl]-1H-indazole
Example 45(b) was prepared from Example 44 in a similar manner to that described for Example 12(d), except that benzoyl chloride was used instead of 5-methyl-thiazole-2-carboxylic acid and HATU: ^{1}H NMR (300 MHz, CDCl$_3$) δ 11.9 (bs, 1H), 8.70 (s, 1H), 8.43 (s, 1H), 8.39 (d, 1H, J = 8.4 Hz), 7.99 (s, 1H), 7.9-7.8 (m, 4H), 7.65 (d, 1H, J = 8.4 Hz), 7.48 (t, 2H, J = 7.8 Hz), 7.42-7.35 (m, 3H), 7.20 (t, 2H, 2.2 Hz), 6.28 (t, 2H, J = 2.2 Hz).

Example 46: 6-[N-(3-aminophenyl)amino]-3-E-styryl-1H-indazole
Example 46 was prepared from the starting material described below in a similar manner to that described for Example 13(i). ^{1}H NMR (300 MHz, DMSO-d$_6$) δ

12.6 (s, 1H), 8.07 (s, 1H), 7.97 (d, 1H, J = 8.73 Hz), 7.69 (d, 1H, J = 8.49 Hz), 7.40

The starting material was prepared as follows:

(i)
5

To a solution of 2-fluoro-5-nitro-phenylamine (3.12 g, 20 mmol) in

dichloromethane (20 ml) at 23 °C under argon was added pyridine (1.94 ml, 24

mmol) and benzoyl chloride (2.8 ml, 24 mmol). After 45 minutes a white

precipitate formed. The reaction mixture was concentrated *in-vacuo* then diluted

10   with water and filtered to give a white solid which was re-suspended in MeOH and

filtered again giving N-(2-fluoro-5-nitro-phenyl)-benzamide (4.86 g, 93%). H

NMR (300 MHz, CDCl₃) δ 9.48 (dd, 1H, J = 6.8 Hz, J = 2.81 Hz), 8.17 (bs, 1H),

8.03 (m, 1H), 7.92 (m, 2H), 7.52-7.65 (m, 3H), 7.31 (d, 1H, J = 9.2 Hz).

(ii)
15

A mixture of N-(2-fluoro-5-nitro-phenyl)-benzamide (4.86 g, 18.7 mmol) and 10%

Pd/C (486 mg) in a 1:1 mixture of THF-MeOH (80 ml) was hydrogenated at 23 °C.

After 2.5 h the reaction mixture was filtered through celite and concentrated to give N-

(5-Amino-2-fluoro-phenyl)-benzamide (3.92 g, 91%). MS (ESI+) [M+H]/z Calc'd

231, found 231.

(iii)
·5   6-[N-(3-Benzamido-4-fluorophenyl)amino]-1-(2-trimethylsilanyl-ethoxymethyl-3-E-

styryl1H-indazole was prepared in a similar manner as Example 48(a), step (iii) except

that N-(5-amino-2-fluoro-phenyl)-benzamide, and the compound prepared in Example

14, step (i) were used as starting materials. ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.38 (dd,

4.50 (q, 2H, J = 7.16 Hz), 2.27 (s, 3H), 2.26 (s, 3H), 1.38 (t, 3H, J = 7.11 Hz). MS

5   (ESI+) [M+H]/z Calc'd 496, found 496. Anal. Calc'd: C, 67.86; H, 5.29; N, 19.79.

Found: C, 66.24; H, 5.50; N, 18.61.

The starting material was prepared as follows:

(i)
10   A mixture of 1-fluoro-5-methyl-2,4-dinitro-benzene (1.0 g, 5 mmol) and 10% Pd/C

(200 mg) in MeOH (20 ml) was hydrogenated at 23 °C for 24 h. The reaction mixture

was filtered through celite and concentrated. Purification by silica gel chromatography

(1:1 ethyl acetate-hexane) gave 4-fluoro-6-methyl-benzene-1,3-diamine (613 mg,

87%).

15   (ii)
To a solution of carbonic acid 4-nitro-phenyl ester 2-trimethylsilanyl-ethyl ester (566

mg, 2 mmol) in DMF (4 ml) at 23 °C under an atmosphere of argon was added DMAP

(12 mg, 0.1 mmol), DIEA (0.35 ml, 2 mmol) and 4-fluoro-6-methyl-benzene-1,3-

20   diamine. The resulting solution was heated to 50 °C for 48 h. The reaction mixture

was quenched with saturated NaHCO$_3$ (aq), extracted with EtOAc (3x 20 ml). The

EtOAc was removed in-vacuo, and the residue was re-dissolved in Et$_2$O then washed

with 3 N NaOH (aq), water, brine, dried with Na$_2$SO$_4$, filtered and concentrated.

Purification by silica gel chromatography (2:8-7:3 ethyl acetate-hexane) gave (5-

5   amino-4-fluoro-2-methyl-phenyl)-carbamic acid 2-trimethylsilanyl-ethyl ester (160

mg, 28%). MS (ESI+) [M+H]/z Calc'd 634, found 634.

(iii)
To a mixture of 6-Iodo-3-((E)-2-pyridin-2-yl-vinyl)-1-(2-trimethylsilanyl-

10   ethoxymethyl)-1H-indazole (224 mg, 0.47 mmol), 5-amino-4-fluoro-2-methyl-

phenyl)-carbamic acid 2-trimethylsilanyl-ethyl ester (160 mg, 0.56 mmol), Cs$_2$CO$_3$

(214 mg, 0.66 mmol), PdCl$_2$(PPh$_3$)$_2$ (5.4 mg, 0.0059 mmol) and BINAP (10 mg,

0.0176 mmol) under argon at 23 °C was added toluene (0.5 ml). The resulting mixture

was heated to 80 °C for 16 h. The reaction mixture was cooled to 23 °C then diluted

15   with water (20 ml) and extracted with EtOAc (3 x 50 ml). The organics were washed

with water (30 ml), brine (30 ml), dried with Na$_2$SO$_4$ filtered and the concentrated to a

foam. Silica gel column (3:7 ethyl acetate-hexane) provided {4-Fluoro-2-methyl-5-[3-

((E)-2-pyridin-2-yl-vinyl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-

ylamino]-phenyl}-carbamic acid 2-trimethylsilanyl-ethyl ester (98 mg, 33%). TLC (7-

20   3 hexane-ethyl acetate) R$_f$sm 0.42, R$_f$p 0.23. ^{1}H NMR (CDCl$_3$) δ 8.64 (dd, 1H, J =

2-ethyl-5-methyl-2*H*-pyrazole-3-carboxylic acid (2-fluoro-5-nitro-phenyl)-

amide was prepared in a similar manner as Example 47, step (i) except that 2-ethyl-5-

methyl-2*H*-pyrazole-3-carboxylic acid and HATU were used instead of benzoyl

5   chloride. MS (ESI+) [M+H]/z Calc'd 293, found 293.

(ii)
2-ethyl-5-methyl-2*H*-pyrazole-3-carboxylic acid (2-fluoro-5-nitro-phenyl)-amide was

prepared in a similar manner as 40(b), step (i). MS (ESI+) [M+H]/z Calc'd 263,

10   found 263.

(iii)
6-[3-(5-amino-2-fluorophenyl)carbamoyl-5-methyl-2-ethyl-2H-pyrazol-4-yl]-

3-E-[2-(pyridin-2-yl)ethenyl]-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole was

15   prepared in a similar manner as Example 48(a), step (iii) except 2-Ethyl-5-methyl-

306

2*H*-pyrazole-3-carboxylic acid (5-amino-2-fluoro-phenyl)-amide was used as starting

material. MS (ESI+) [M+H]/z Calc'd 612, found 612.

Example 51: 6-pyrid-4-yl-3-E-(N-(pyrrol-1-yl)iminomethyl)-1H-indazole
5   6-Pyrid-4-yl-3-E-(N-(pyrrol-1-yl)iminomethyl)-1-(2-trimethylsilanyl-

ethoxymethyl)-1H-indazole was converted to 6-pyrid-4-yl-3-E-(N-(pyrrol-1-

yl)iminomethyl)-1H-indazole in a similar manner to that described for Example 29(a).

^{1}H NMR (300 MHz, CDCl$_3$) δ 8.76 (s, 1H), 8.67 (d, 2H, J= 6.1 Hz), 8.53 (d, 1H, J=

8.4 Hz), 7.74 (s, 1H), 7.61 (d, 2H, J= 6.2 Hz), 7.54 (d, 1H, J= 8.5 Hz), 7.27- 7.25 (m,

10   2H), 6.31- 6.29 (m, 2H). MS (ES) [M+H]/z Calc'd 288, found 288. Anal. Calc'd, C

(71.07), H (4.56), N (24.37). Found: C (70.81), H (4.57), N (24.14).

The starting material was prepared as follows:
A solution of 6-pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole-3-

15   carbaldehyde (208 mg, 0.59 mmol), N-aminopyrrole (145 mg, 1.76 mmol), and acetic

acid (5.8 µl) in ethanol (1 ml) was held at 95 °C for 16 h. The solution was then

evaporated under reduced pressure, and purified by silica gel chromatography to give

6-pyrid-4-yl-3-E-(N-(pyrrol-1-yl)iminomethyl)-1-(2-trimethylsilanyl-ethoxymethyl)-

1H-indazole as an oil (140 mg, 57%). ^{1}H NMR (300 MHz, CDCl$_3$) • 9.08 (s, 1H),

8.71 (d, 2H, J= 6.1 Hz), 8.46 (d, 1H, J= 8.5 Hz), 8.34 (s, 1H), 7.85 (d, 2H, J=6.2 Hz),

7.80 (d, 1H, J= 8.5 Hz), 7.56 (t, 2H, J= 2.3 Hz), 6.25 (t, 2H, J= 2.3 Hz), 5.93 (s, 1H),

5.74 (s, 2H), 3.64 (t, 2H, J= 7.9 Hz), 0.86 (t, 2H, J= 7.9 Hz), 0.00 (s, 9H).

Example 52(a): 6-(7-azaindazol-4-yl)-3-E-styryl-1H-indazole
Sem-Example 52(a) was converted to Example 52(a) in a similar manner to

that described for Example 27(a). ^{1}H NMR (300 MHz, DMSO-d$_6$) δ 8.63 (d, 1H, J=

4.8 Hz), 8.41 (d, 1H, J=8.5 Hz), 8.37 (s, 1H), 7.99 (s, 1H), 7.76 (d, 2H, J=7.3 Hz),

7.70 (d, 1H, J=8.5 Hz), 7.60-7.85 (m, 6H). HRMS (FAB) [M+H]/z Calc'd 338.1400,

found 338.1389. Analyzed with 1.1 trifluoroacetic acid, Calc'd, C (60.21), H (3.51),

N (15.13). Found: C (59.93), H (3.59), N (14.86).

The starting material was prepared as follows:

(i)
A solution of 3-styryl-1-(2-trimethylsilanyl-ethoxymethyl)-6-trimethylstannyl-1H-

indazole (1.0 g, 1.90 mmol), 1-(4-iodo-pyrazolo[3,4-b]pyridin-1-yl)-ethanone (0.56 g,

1.90 mmol), AsPh$_3$ (116 mg, 0.38 mmol), and Pd$_2$dba$_3$ (87 mg, 0.09 mmol) in

degassed dioxane (10 ml) was heated at 110 °C for 3 h. The solution was then diluted

with ethyl acetate (50 ml), washed with brine (2x10 ml), dried over MgSO$_4$, and

concentrated under reduced pressure. Purification by silica gel chromatography gave

Example 52(a) as a white solid (412 mg, 46%). ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.82

(d, 1H, J=5.8 Hz), 8.52 (s,1H), 8.29 (d, 1H, J=8.2 Hz), 8.05 (s, 1H), 7.73- 7.32 (m,

5   10H), 5.86 (s, 2H), 3.69 (t, 2H, J= 8.2 Hz), 0.97 (t, 2H, J= 8.2 Hz), -0.03 (s, 9H).

(ii)
A solution of 6-iodo-3-styryl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazole (2.90

g, 6.10 mmol), hexamethylditin (2.00 g, 6.12 mmol), and Pd(PPh$_3$)$_4$ (282 mg, 0.24

10 mmol) in degassed dioxane (10 ml) was heated at 110 °C for 3 h. The solution was

then diluted with ethyl acetate (200 ml), washed with brine (2x20 ml), dried over

MgSO$_4$, and evaporated under reduced pressure. Purification by silica gel

chromatography gave 3-styryl-1-(2-trimethylsilanyl-ethoxymethyl)-6-trimethylstannyl-

1H-indazole as a yellow oil (3 g, 96%). ^{1}H NMR (300 MHz, CDCl$_3$) δ 8.02 (d, 1H, J=

15 7.4 Hz), 7.71 (s, 1H), 7.71- 7.29 (m, 8H), 5.77 (s, 2H), 3.65 (t, 2H, J= 16.3 Hz), 0.95

(t, 2H, J= 16.4 Hz), 0.38 (s, 9H), -0.03 (s, 9H).

(iii)
A mixture of 4-chloro-1H-pyrazolo[3,4-b]pyridine (820 mg, 5.30 mmol), sodium

iodide (2.4 mg, 16.0 mmol), and acetyl chloride (0.8 ml) in acetonitrile (6 ml) was

refluxed 8 h. The mixture was then treated with a 10% aqueous solution of $NaCO_3$

(10 ml), and a 10% aqueous solution of $NaHSO_3$ (10 ml), and held 10 min. The

5   mixture was extracted with ethyl acetate (50 ml), and the organics were washed with

brine (10 ml), dried over $MgSO_4$, and evaporated under reduced pressure. Purification

by silica gel chromatography gave 1-(4-iodo-pyrazolo[3,4-b]pyridin-1-yl)-ethanone as

a brown solid (650 mg, 42%). ^{1}H NMR (300 MHz, $CDCl_3$) δ 8.39 (d, 1H, J=5.0 Hz),

8.04 (s, 1H), 7.76 (d, 1H, J=5.0 Hz), 2.88 (s, 3H).

10   (iv)
1,7-Dihydro-pyrazolo[3,4-b]pyridin-4-one (1.2 g, 8.8 mmol) (Dorn, H. et al., *Prakt.*

Chem., 324, 557-62 (1982)) in $POCl_3$ (15 ml) at 0 °C was treated with PCl_5 (2.5 mg,

0.01 mmol). The solution was allowed to warm to rt over 1h, then heated to 90 °C and

15   held 3h. The solution was concentrated under reduced pressure, then treated with ice

and water (50 ml). The resulting mixture was extracted with ethyl acetate (100 ml),

and the organic layer was washed with a saturated aqueous solution of sodium

bicarbonate (30 ml). The organic layer was dried over $MgSO_4$, then evaporated under

reduced pressure to give 4-chloro-1H-pyrazolo[3,4-b]pyridine as a yellow solid (820

20   mg, 60%). ^{1}H NMR (300 MHz, $CDCl_3$) δ 8.57 (d, 1H, J= 5.2 Hz), 8.25 (s, 1H), 7.28

(d, 1H, J= 5.2 Hz).

Example 52(b): 6-(7-azaindol-4-yl)-3-E-styryl-1H-indazole
Sem-iodoindazole was converted to Example 52(b) in a similar manner to that

described for Example 27(a). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.40 (d, 1H, J= 5.3

5   Hz), 8.53 (d, 1H, J= 8.6 Hz), 7.74- 7.35 (m, 10 H), 6.90 (s, 1H). HRMS (FAB)

[M+H]/z Calc'd 337.1448, found 337.1457. Analyzed with 0.3 H$_2$O, Calc'd, C

(77.31), H (4.90), N (16.39). Found: C (77.51), H (4.88), N (16.27).

The starting material was prepared as follows:

(i)
10

4-Chloro-1*H*-pyrrolo[2,3-b]pyridine (Clark, B. A. et al., *J. Chem. Soc. P1*, 2270-74

(1974)) was converted to 4-iodo-1*H*-pyrrolo[2,3-b]pyridine in a similar manner to that

described for Example 52(a). ^{1}H NMR (300 MHz, MeOH-d$_4$) δ 8.10 (m, 1H), 7.89 (d,

1H, J=5.0 Hz), 7.58 (m, 1H), 7.50 (d, 1H, J= 5.0 Hz), 6.26 (br s, 1H).

15   **Example 53(a): 3-(1H-benzoimidazol-2-yl)-N-(4-hydroxyphenyl)-1H-indazole-6-**
carboxamide

To a solution of 3-(1H-benzoimidazol-2-yl)-1H-indazole-6-carboxylic acid

(208 mg, 0.7 mmol) in dry dimethylformamide (6 mL) was added 4-aminophenol (82

mg, 0.7 mmol) followed by HATU (312 mg, 0.8 mmol) and then triethylamine (20

5   drops) was added. The reaction was stirred overnight at room temperature. LC/MS

showed desired product as major component. The solvent was removed by vacuum.

The residue remaining was taken up in water and ethyl acetate. The layers were

separated and the organic layer was concentrated under vacuum. The residue was

dissolved in methanol (10 mL) and half of this solution was purified by HPLC using a

10   gradient of 5% acetonitrile/water to 55% acetonitrile/water over 60 minutes with 0.1%

trifluoroacetic acid in the water. The title compound was isolated as a solid (20 mg).

^{1}H NMR (methanol-d_4) δ 6.87 (2H, d, 8.8 Hz), 7.55 (2H, d, 8.7 Hz), 7.61 (2H, m),

7.87 (2H, br s), 8.00 (1H, d, 8.4 Hz), 8.35 (1H, s), 8.52 (1H, d, 8.6 Hz). MS (APCI

pos) 370.1.

15   The starting material was prepared as follows:

(i)

312
To 1H-indole-6-carboxylic acid (2.0g, 12.42mmol) in water (100mL) was added

NaNO$_2$ (8.56g, 124.2mmol). To this suspension was then slowly added dropwise via

addition funnel 6N HCL (16mL). The resulting slurry was allowed to stir at room

temperature overnight. The solid precipitate was filtered and washed with water

5   (50mL) to provide 2.35 g (100%) of 3-formyl-1H-indazole-6-carboxylic acid. ^{1}H

NMR (DMSO-d$_6$) δ 14.46 (1H, s), 10.21 (1H, s), 8.26 (1H, s), 8.20 (1H, d, J = 8.5Hz),

7.90 (1H, d, J = 8.3Hz). MS (APCI positive) 205 (methyl ester).

(ii)
10   To 3-formyl-1H-indazole-6-carboxylic acid (2.35g, 12.42mmol) in DMF (60mL) was

added 1,2-phenylenediamine (12.42mmol, 1.34g) and sulfur powder (1.1eq,

13.66mmol). This mixture was then heated to reflux for 6 hours. The reaction was

followed by TLC and LC-MS. After cooling, water (50mL) was added to the reaction

and the brown precipitate which formed was filtered and collected to provide 3.1 g

15   (90%) of 3-(1H-benzoimidazol-2-yl)-1H-indazole-6-carboxylic acid. ^{1}H NMR

(DMSO-d$_6$) δ 14.01 (1H, s), 8.58 (1H, d, J = 8.5Hz), 8.24 (1H, s), 7.87 (1H, d, J =

8.7Hz), 7.64 (2H, m), 7.25 (2H, m). MS (APCI positive) 279.

Example 53(b): 3-(1H-Benzoimidazol-2-yl)-N-cyclopropyl-1H-indazole-6-

carboxamide

313
To 3-(1H-benzoimidazol-2-yl)-1H-indazole-6-carboxylic acid (200mg,

0.719mmol) in DMF (30mL) was added cyclopropylamine (98mg, 0.719mmol),

HATU (0.719mmol, 273mg), and triethylamine (0.726mmol, 0.1mL). This solution

5   was allowed to stir at room temperature overnight. The reaction was worked up via

aqueous wash and extraction with ethyl acetate (3x50mL). The organic layer was then

dried with MgSO₄, filtered and concentrated to yield a dark oil. Flash column

chromatography (30-70% Ethyl Acetate / Petroleum Ether) afforded the 3-(1H-

benzoimidazol-2-yl)-N-cyclopropyl-1H-indazole-6-carboxamide as a yellow solid.

10   (0.130g, 57%) ^{1}H NMR (DMSO-d₆) δ 13.88 (1H, s), 8.63 (1H, m), 8.51 (1H, d, J =

8.5Hz), 8.09 (1H, s), 7.75 (1H, d, J = 8.7Hz), 7.63 (2H, br s), 7.21 (2H, m), 2.89 (1H,

m), 0.72 (2H, m), 0.63 (2H, m). MS (APCI positive) 318.1.

Example 53(c): 3-(1H-benzoimidazol-2-yl)-N-(4-hydroxy-3-methylphenyl)-1H-

indazole-6-carboxamide

15
Example 53(c) was prepared in a similar manner to that described for Example

53(a), except 3-methyl-4-aminophenol was used in place of 4-aminophenol. ^{1}H NMR

(DMSO-d₆) δ 8.59 (1H, d, J = 8.3Hz), 8.25 (1H, s), 7.89 (1H, dd, J = 1.3, 8.5Hz),

314

7.68 (2H, br s), 7.28 (2H, m), 7.14 (1H, d, J = 8.5Hz), 6.74 (1H, s), 6.68 (2H, dd, J =

3.0, 8.3Hz). MS (APCI positive) 384.1.

Example 53(d): 3-(1H-benzoimidazol-2-yl)-N-(4-hydroxy-2,3-dimethylphenyl)-

1H-indazole-6-carboxamide

5
Example 53(d) was prepared in a similar manner to that described for Example

53(a), except that 2,3-dimethyl-4-aminophenol was used in place of 4-aminophenol.

^{1}H NMR (DMSO-d$_6$) δ 9.93 (1H, s), 9.22 (1H, s), 8.56 (1H, d, J = 8.5Hz), 8.25 (1H,

s), 7.90 (1H, d, J = 8.5Hz), 7.73 (1H, br s), 7.53 (1H, br s), 7.23 (2H, br s), 6.92 (1H,

10   d, J = 8.3Hz), 6.68 (1H, d, J = 8.5Hz), 2.09 (6H, br s). MS (APCI positive) 398.4.

Example 53(e): 3-(1H-Benzoimidazol-2-yl)-1H-indazole-6-carboxamide
Example 53(e) was prepared in a similar manner to that described for Example

53(a), except that 1,1,1,3,3,3-hexamethyldisilazane was used in place of 4-

15   aminophenol. ^{1}H NMR (DMSO-d$_6$) δ 13.91 (1H, s), 13.04 (1H, s), 8.52 (1H, d, J =

8.3Hz), 8.20 (1H, br s), 8.15 (1H, s), 7.81 (1H, d, J = 7.7Hz), 7.75 (1H, d, J = 6.6Hz),

7.51 (2H, m), 7.21 (2H, m). MS (APCI positive) 278.1.

Example 53(f): 3-(1H-benzoimidazol-2-yl)-N-benzyloxy-1H-indazole-6-

carboxamide
Example 53(f) was prepared in a similar manner to that described for Example

5   53(a) except that O-benzylhydroxylamine was used in place of 4-aminophenol. ^{1}H

NMR (DMSO-d$_6$) δ 13.94 (1H, s), 13.06 (1H, s), 11.97 (1H, s), 8.55 (1H, d, J =

8.8Hz), 8.02 (1H, s), 7.78 (1H, d, J = 8.3Hz), 7.52 (1H, d, J = 8.3Hz), 7.50 (3H, m),

7.40 (3H, m), 7.22 (2H, m), 4.97 (2H, s). MS (APCI positive) 384.2.

Example 53(g): 3-(1H-benzoimidazol-2-yl)-N-(3-fluoro-4-hydroxyphenyl)-1H-

10   **indazole-6-carboxamide**
Example 53(g) was prepared in a similar manner to that described for Example

53(a) except that 3-fluoro-4-aminophenol was used in place of 4-aminophenol. ^{1}H

NMR (CH$_3$OD) δ 8.58 (1H, d, J = 8.5Hz), 8.20 (1H, s), 7.84 (1H, d, J = 8.7Hz), 7.68

15   (2H, br s), 7.63 (1H, dd, J = 2.4, 13Hz), 7.29 (3H, m), 6.92 (1H, t, J = 9.2Hz). MS

(APCI positive) 388.3.

Example 54(a): 3-(5,6-Difluoro-1H-benzoimidazol-2-yl)-N-(4-hydroxyphenyl)-

1H-indazole-6-carboxamide
Using the same procedure as for the synthesis of 3-(1H-benzoimidazol-2-yl)-

5   1H-indazole-6-carboxylic acid in Example 53(a), step (ii), N-(4-hydroxyphenyl)-3-

formyl-1H-indazole-6-carboxamide and 4,5-difluoro1,2-phenylenediamine gave 3-

(5,6-difluoro-1H-benzoimidazol-2-yl)-N-(4-hydroxyphenyl)-1H-indazole-6-

carboxamide as a tan solid. ^{1}H NMR (DMSO-d$_6$) δ 13.99 (1H, s), 13.27 (1H, s),

10.21 (1H, s), 9.25 (1H, s), 8.52 (1H, d, J = 8.7 Hz), 8.21 (1H, s), 7.85 (1H, d, J = 9.0

10   Hz), 7.80 (1H, t, J = 9.8 Hz), 7.55 (2H, d, J = 8.7 Hz), 7.47 (1H, t, J = 9.8 Hz), 6.75

(2H, d, J = 8.7Hz). MS (APCI positive) 406.

The starting material was prepared as follows:

(i)
15   To a solution of 3-formyl-1H-indazole-6-carboxylic acid (1.6 g, 8.4 mmol) and 4-

aminophenol (1.8 g, 16.8 mmol) in dry dimethylformamide (35 mL) was added HATU

(3.8 g, 16.8 mmol) followed by triethylamine (1.4 mL, 10.1 mmol). The reaction was

stirred at room and monitored by TLC and LC/MS. After two hours the reaction was

complete. The solvent was removed by vacuum and the product was purified by flash

column chromatography using ethyl acetate: petroleum ether 1:1 to pure ethyl acetate.

N-(4-Hydroxyphenyl)-3-formyl-1H-indazole-6-carboxamide was isolated as a tan

colored solid. ^{1}H NMR (DMSO-d$_6$) δ 6.79 (2H, d, 8.9 Hz), 7.59 (2H, d, 8.9 Hz), 7.94

5   (1H, d, 9.8 Hz), 8.24 (1H, d, 8.2 Hz), 8.31 (1H, s), 9.31 (1H, br s), 10.27 (2H, s). MS

(APCI pos) 282.1.

Example 54(b): 3-(5,6-Dichloro-1H-benzoimidazol-2-yl)-N-(4-hydroxyphenyl)-

1H-indazole-6-carboxamide
10   Example 54(b) was prepared in a similar manner to that described for Example

54(a), except that 4,5-dichloro-1,2-phenylenediamine was used in place of 4,5-

difluoro-1,2-phenylenediamine. ^{1}H NMR (DMSO-d$_6$) δ 14.08 (1H, s), 13.38 (1H, s),

10.22 (1H, s), 9.27 (1H, s), 8.52 (1H, d, J = 8.7 Hz), 8.23 (1H, s), 8.02 (1H, s), 7.86

(1H, d, J = 8.7 Hz), 7.70 (1H, s), 7.55 (2H, d, J = 8.7 Hz), 6.75 (2H, d, J = 8.7Hz).

15   MS (APCI positive) 438.

Example 54(c): 3-(5-Methoxy-1H-benzoimidazol-2-yl)-N-(4-hydroxyphenyl)-1H-

indazole-6-carboxamide
Example 54(c) was prepared in a similar manner to that described for Example

54(a), except that 4-methoxy-1,2-phenylenediamine was used in place of 4,5-difluoro-

1,2-phenylenediamine. ^{1}H NMR (DMSO-d$_6$) δ 13.76 (1H, s), 12.77 (1H, s), 10.13

5   (1H, s), 9.17 (1H, s), 8.45 (1H, d, J = 8.3 Hz), 8.11 (1H, s), 7.75 (1H, d, J = 8.6 Hz),

7.46 (2H, d, J = 8.7 Hz), 7.32 (1H, d, J = 8.3 Hz), 6.91 (1H, s), 6.77 (1H, m), 6.67

(2H, d, J = 8.7Hz), 3.72 (3H, s). MS (APCI positive) 400.

Example 54(d): 3-[1H-Naphtho(2,3-d)imidazol-2-yl]-N-(4-hydroxyphenyl)-1H-

indazole-6-carboxamide

10
Example 54(d) was prepared in a similar manner to that described for Example

54(a), except that 2,3-naphthalenenediamine was used in place of 4,5-difluoro-1,2-

phenylenediamine. ^{1}H NMR (DMSO-d$_6$) δ 14.11 (1H, s), 13.10 (1H, s), 10.24 (1H,

s), 9.27 (1H, s), 8.64 (1H, d, J = 8.7 Hz), 8.28 (1H, s), 8.25 (1H, s), 7.97 (2H, m), 7.73

15   (1H, br s), 7.89 (1H, d, J = 8.6 Hz), 7.56 (2H, d, J = 8.7 Hz), 7.38 (2H, b), 6.76 (2H,

d, J = 8.7 Hz). MS (APCI positive) 420.

Example 54(e): 3-[1H-Naphtho(1,2-d)imidazol-2-yl]-N-(4-hydroxyphenyl)-1H-indazole-6-carboxamide
Example 54(e) was prepared in a similar manner to that described for Example

5   54(a), except that 1,2-naphthalenenediamine was used in place of 4,5-difluoro-1,2-

phenylenediamine. ^{1}H NMR (DMSO-d$_6$) δ 13.93 (1H, s), 13.38 (1H, s), 10.23 (1H,

Example 55: 3-1*H*-Benzoimidazol-2-yl-6-pyridin-4-yl- 1*H*-indazole
Sem-Example 55 was converted to Example 55 in a similar manner to that described

for Example 27(a). ^{1}H NMR (300 MHz, CDCl$_3$ + MeOH-d$_4$ + DMSO-d$_6$) δ 8.71-8.64

5   (m, 3H), 8.03 (s, 1H), 7.86 (dd, 2H, J=4.7, 1.6 Hz), 7.77-7.72 (m, 3H̄), 7.32 (dd, 2H,

J=6.0, 3.1 Hz). HRMS (FAB) [M+H]/z Calc'd 312.1244, found 312.1253. Analyzed

with 1.40 H$_2$O, Calc'd, C (67.80), H (4.73), N (20.81). Found: C (68.06), H (4.45),

N (20.68).

The starting material was prepared as follows:

10
A solution of 6-pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-

indazole-3-carbaldehyde (0.70 g, 2.0 mmol), benzene-1,2-diamine (0.26 g, 2.4 mmol)

and sulfur (77 mg, 2.4 mmol) in DMF (10 ml) was heated in an oil bath at 90 °C

overnight. The resulting mixture was poured into brine (200 ml), then extracted with

15   EtOAc (3x60 ml). The combined organic layer was dried over MgSO$_4$ and

concentrated under reduced pressure. The resulting oil was purified by silica gel

chromatography to yield 6-pyridin-4-yl-1-(2-trimethylsilanyl-ethoxymethyl)-3-[1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-benzoimidazol-2-yl]-1*H*-indazole as a light

brown oil (0.75 g, 65%). ^{1}H NMR (CDCl$_3$) δ 8.82 (d, 1H, J=8.5Hz), 8.73 (d, 1H,

8.5 Hz), 7.27 (d, 1H, J = 16.9 Hz), 7.13-7.12 (m, 3H), 7.00-6.94 (m, 3H), 6.78 (s,

1H), 4.39 (q, 2H, J = 7.1 Hz), 2.23 (s, 3H), 2.19 (s, 3H), 1.28 (t, 3H, J = 7.1 Hz).

Anal. calcd for $C_{26}H_{25}N_7O_2$ x 0.5 H_2O x 0.4 hexanes (511.0 g/mol): C, 66.75; H, 6.23;

N, 19.19. Found: C, 66.95; H, 6.25; N, 18.83.

The starting materials were prepared as follows:

5   (i) Preparation of 1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-imidazole
1*H*-Imidazole (2.0 g, 29.4 mmol, 1.0 eq) in THF (70 mL) was added to a 0 °C

suspension of sodium hydride (1.5 g, 60% in mineral oil, 38.2 mmol, 1.3 eq) in THF

(30 mL). After gas evolution ceased, the mixture was warmed to room temperature

10   for 45 minutes and then recooled to 0 °C. [2-(Trimethylsilyl)ethoxy]methyl chloride

(5.4 mL, 30.2 mmol, 1.0 eq) was added, and the mixture was warmed to room

temperature overnight. The reaction was quenched with saturated sodium

bicarbonate, the THF removed under reduced pressure, and the resultant beige slurry

extracted with ethyl acetate. The extracts were combined, washed with brine, dried

15   over magnesium sulfate, filtered, and concentrated to give 6.9 g of an amber oil. The

oil was purified by flash chromatography on silica gel using 2% methanol-chloroform

as the eluant to give 1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-imidazole as a light

amber oil (4.7 g, 81%): TLC R_f = 0.3 (5% methanol-chloroform); ^{1}H NMR (300

MHz, DMSO-d_6) δ 7.77 (s, 1H), 7.26 (d, 1H, J = 1.2 Hz), 6.93 (s, 1H), 5.32 (s, 2H),

20   3.45 (t, 2H, J = 8.0 Hz), 0.83 (t, 2H, J = 8.0 Hz), -0.05 (s, 9H); ^{13}C NMR (75 MHz,

DMSO-d_6) δ 137.9, 128.8, 119.6, 74.8, 65.1, 17.1, -1.4.

<u>(ii) Preparation of [1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-imidazol-2-yl]-methanol</u>
1-(2-Trimethylsilanyl-ethoxymethyl)-1*H*-imidazole (3.0 g, 15.4 mmol, 1.0 eq) was

dissolved in THF (150 mL) and cooled to – 78 °C. *n*BuLi (10.6 mL, 1.6 M in

hexanes, 16.9 mmol, 1.1 eq) was added and the temperature was allowed to increase

5   to – 40 °C over 15 minutes. The light yellow solution was stirred for an additional 30

minutes at – 40 °C then the anion was quenched with DMF (1.3 mL, 16.9 mmol, 1.1

eq). The reaction mixture was warmed to room temperature overnight then quenched

with water. The solvent was removed and the mixture was extracted with

dichloromethane. The organic layer was washed with water, dried with brine and

10   magnesium sulfate, filtered and concentrated to give the crude product (3.5 g; TLC R_f

= 0.5 (5% methanol-chloroform). The proton NMR spectrum gives the aldehydic

proton at 9.73 ppm (300 MHz, DMSO-d_6). The crude product was dissolved in

methanol (15 mL), cooled to 0 °C, and treated with sodium borohydride (1.2 g, 30.8

mmol, 2.0 eq). The reaction mixture was warmed to room temperature overnight.

15   The solvent was removed and the crude product was diluted with chloroform, washed

with water, dried with brine and magnesium sulfate, filtered and concentrated to give

a clear oil (3.6 g). The oil was purified by flash chromatography on silica gel using

3-6% methanol-chloroform with 0.1% ammonium hydroxide as the eluant to give [1-

(2-trimethylsilanyl-ethoxymethyl)-1*H*-imidazol-2-yl]-methanol as a white solid (1.4

20   g, 41% 2-steps): TLC R_f = 0.4 (8% methanol-chloroform); ^{1}H NMR (300 MHz,

DMSO-d_6) δ 7.22 (d, 1H, J = 1.1 Hz), 6.81 (d, 1H, J = 1.0 Hz), 5.36 (s, 2H), 5.31 (br.

t, 1H, J = 5.2 Hz), 4.50 (d, 2H, J = 4.8 Hz), 3.48 (t, 2H, J = 8.0 Hz), 0.83 (t, 2H, J =

8.0 Hz), -0.05 (s, 9H); ^{13}C NMR (75 MHz, DMSO-d_6) δ 148.9, 127.8, 122.5, 75.5,

(vi) Preparation of benzhydrylidene-{2-methyl-5-[3-((E)-styryl)-1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-indazol-6-yloxy]-phenyl}-amine
A round bottom flask was charged with potassium phosphate (5.5 g, 26.0 mmol, 2.0

15   eq), 3-(benzhydrylidene-amino)-4-methyl-phenol (3.9 g, 13.6 mmol, 1.1 eq), 6-iodo-

3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazole (6.2 g, 13.0 mmol,

1.0 eq) and o-xylene (130 mL). The resultant slurry was degassed, purged with argon

and treated with a mixture of tris(dibenzylideneacetone)dipalladium(0) (916 mg, 1.1

mmol, 8 mol%) and biphenyl-2-yl-di-*tert*-butyl-phosphane (656 mg, 2.2 mmol, 16

mol%). The flask was immersed in an oil bath and stirred at 100 °C for 18 hours.

The black slurry was cooled to room temperature, filtered through celite and

concentrated. The black oil was dissolved in chloroform, washed with water, brine,

5   dried over magnesium sulfate, filtered and concentrated to give a black oil (12.1 g).

The crude product was purified by flash chromatography on silica gel using 10-15%

ether-cyclohexane as the eluant to give benzhydrylidene-{2-methyl-5-[3-((E)-styryl)-

1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-indazol-6-yloxy]-phenyl}-amine as a yellow

foam from ether (1.4 g, 16%): HPLC R$_t$ = 24.3 min.; TLC R$_f$ = 0.5 (20% ether-

10   cyclohexane); ^{1}H NMR (300 MHz, DMSO-d_6) δ 8.10 (d, 1H, J = 8.8 Hz), 7.75-7.66

(m, 4H), 7.53-7.31 (m, 11H), 7.14-7.08 (m, 4H), 6.62 (dd, 1H, J = 8.8, 2.0 Hz), 6.55

0.11 (s, 9H).

(viii) Preparation of 2-ethyl-5-methyl-2H-pyrazole-3-carboxylic acid {2-methyl-5-

[3-((E)-styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-yloxy]-phenyl}-

5   amide
White foam (85%); HPLC R$_t$ = 21.5 min.; TLC R$_f$ = 0.2 (20% ethyl acetate-

cyclohexane); ^{1}H NMR (300 MHz, DMSO-d_6) δ 9.75 (s, 1H), 8.24 (d, 1H, J = 8.8

Hz), 7.74-7.72 (m, 2H), 7.53 (s, 2H), 7.43-7.38 (m, 2H), 7.34-7.28 (m, 3H), 7.12 (d,

10   1H, J = 2.6 Hz), 7.00 (dd, 1H, J = 8.8, 2.0 Hz), 6.92 (dd, 1H, J = 8.3, 2.5 Hz), 6.78 (s,

1H), 5.69 (s, 2H), 4.40 (q, 2H, J = 7.1 Hz), 3.53 (t, 2H, J = 7.9 Hz), 2.22 (s, 3H), 2.19

(s, 3H), 1.27 (t, 3H, J = 7.1 Hz), 0.78 (t, 2H, J = 7.9 Hz), -0.15 (s, 9H).

(ix) Preparation of 2-ethyl-5-methyl-2H-pyrazole-3-carboxylic acid {5-[3-formyl-1-

(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-yloxy]-2-methyl-phenyl}-amide
15

A solution of 2-ethyl-5-methyl-2H-pyrazole-3-carboxylic acid {2-methyl-5-[3-((E)-

styryl)-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-yloxy]-phenyl}-amide (774

mg, 1.28 mmol, 1.0 eq) in 1,4-dioxane (8 mL) and water (2 mL) was treated with

osmium tetraoxide (7 mg, 0.03 mmol, 0.02 eq). The solution was stirred for 5

minutes then treated with sodium periodate (822 mg, 3.84 mmol, 3.0 eq). The

resultant thick tan slurry was stirred at room temperature overnight, poured into 15%

$Na_2S_2O_3$ (100 mL) and extracted with ethyl acetate. The organic layer was washed

5   with saturated sodium bicarbonate, brine, dried over magnesium sulfate, filtered and

concentrated to give an amber oil (902 mg). The crude product was purified by radial

chromatography on silica gel using 10-50% ethyl acetate-cyclohexane as the eluant to

give 2-ethyl-5-methyl-2*H*-pyrazole-3-carboxylic acid {5-[3-formyl-1-(2-

trimethylsilanyl-ethoxymethyl)-1*H*-indazol-6-yloxy]-2-methyl-phenyl}-amide as a

10   beige solid from ether (590 mg, 86%): HPLC R_t = 18.9 min.; TLC R_f = 0.2 (40%

ethyl acetate-cyclohexane); ^{1}H NMR (300 MHz, DMSO-d_6) δ 10.16 (s, 1H), 9.75 (s,

1H), 8.14 (d, 1H, J = 8.8 Hz), 7.48 (d, 1H, J = 1.8 Hz), 7.32 (d, 1H, J = 8.5 Hz), 7.16-

7.13 (m, 2H), 6.93 (dd, 1H, J = 8.3, 2.6 Hz), 6.78 (s, 1H), 5.84 (s, 2H), 4.39 (q, 2H, J

= 7.1 Hz), 3.55 (t, 2H, J = 7.8 Hz), 2.23 (s, 3H), 2.19 (s, 3H), 1.27 (t, 3H, J = 7.2 Hz),

15   0.79 (t, 2H, J = 7.8 Hz), -0.15 (s, 9H).

(x) Preparation of 2-ethyl-5-methyl-2*H*-pyrazole-3-carboxylic acid [2-methyl-5-(1-

(2-trimethylsilanyl-ethoxymethyl)-3-{(E)-2-[1-(2-trimethylsilanyl-ethoxymethyl)-1*H*-

imidazol-2-yl]-vinyl}-1*H*-indazol-6-yloxy)-phenyl]-amide
A solution of 2-chloromethyl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-imidazole

hydrochloride (344 mg, 1.22 mmol, 2.0 eq) in chloroform (20 mL) was free based

with saturated sodium bicarbonate. The organic layer was dried with brine and

magnesium sulfate, filtered and concentrated to give an amber oil (301 mg, 100%).

5   The resultant oil was dissolved in acetonitrile (12 mL), treated with

triphenylphosphine (304 mg, 1.16 mmol, 1.9 eq) and warmed to 70 °C for 18 hours.

The solvent was removed and the crude 1-(2-trimethylsilanyl-ethoxymethyl)-2-

[(triphenyl-λ^5-phosphanyl)-methyl]-1H-imidazole chloride was dissolved in THF (12

mL), cooled to − 78 °C, and treated with potassium $tert$-butoxide (1.2 mL, 1.0 M in

10   THF, 1.22 mmol, 2.0 eq). After 15 minutes, 2-ethyl-5-methyl-2H-pyrazole-3-

carboxylic acid {5-[3-formyl-1-(2-trimethylsilanyl-ethoxymethyl)-1H-indazol-6-

yloxy]-2-methyl-phenyl}-amide (325 mg, 0.61 mmol, 1.0 eq) in THF (1 mL) was

added to the ylide at − 78 °C. The clear yellow solution was warmed to room

temperature overnight, quenched with water and extracted with ethyl acetate. The

15   organic layer was washed with brine, dried over magnesium sulfate, filtered and

concentrated to give the crude product as an amber oil (1.0 g). The crude product

was purified further by radial chromatography on silica gel using 0-5% methanol-

chloroform as the eluant to give 2-ethyl-5-methyl-2H-pyrazole-3-carboxylic acid [2-

methyl-5-(1-(2-trimethylsilanyl-ethoxymethyl)-3-{(E)-2-[1-(2-trimethylsilanyl-

20   ethoxymethyl)-1H-imidazol-2-yl]-vinyl}-1H-indazol-6-yloxy)-phenyl]-amide as a tan

solid upon standing overnight (390 mg, 88%): HPLC R_t = 20.6 min.; TLC R_f = 0.4

(4% methanol-dichloromethane); ^{1}H NMR (300 MHz, DMSO-d_6) δ 9.75 (s, 1H), 8.14

(d, 1H, J = 8.8 Hz), 7.64 (d, 1H, J = 16.2 Hz), 7.42 (d, 1H, J = 16.3 Hz), 7.39-7.35

(m, 3H), 7.30 (d, 1H, J = 8.5 Hz), 7.12 (d, 1H, J = 2.5 Hz), 7.03 (s, 1H), 6.99 (dd, 1H,

J = 8.8, 1.9 Hz), 6.78 (s, 1H), 5.70 (s, 2H), 5.55 (s, 2H), 4.40 (q, 2H, J = 7.1 Hz),

3.55-3.48 (m, 4H), 2.22 (s, 3H), 2.19 (s, 3H), 1.27 (t, 3H, J = 7.1 Hz), 0.84 (t, 2H, J =

7.9 Hz), 0.77 (t, 2H, J = 7.9 Hz), -0.11 (s, 9H), -0.15 (s, 9H).

5   **Example 59(a): 6-[3-((1-Ethyl-3-methyl-1H-pyrazol-5-yl)carboxamido)benzoyl]-**

3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole hydrochloride
Example 41(a) (4.57 g, 9.59 mmol, 1 equiv) was taken up in methanol (96

mL) and was protected from light with aluminum foil. A second flask with methanol

10   (20 mL) was treated with acetyl chloride (684 μL, 1.00 equiv) for 5 min. The acid

solution was then added to the first mixture with several methanol washes (~20 mL).

The volatile material was removed under reduced pressure and the residue was

triturated with 1:1 ethyl acetate-hexane to give, after filtering and drying, a yellow

powder (4.82 g, 98%): Analyzed with 1.0 H_2O Calc'd, C (61.85), H (5.07), N

15   (15.46). Found: C (61.15), H (5.15), N (15.38).

The exemplary compounds described above may be tested for their activity

using the tests described below.

BIOLOGICAL TESTING; ENZYME ASSAYS

10 The stimulation of cell proliferation by growth factors such as VEFG, FGF,

and others is dependent upon their induction of autophosphorylation of each of

their respective receptor's tyrosine kinases. Therefore, the ability of a protein

kinase inhibitor to block autophosphorylation can be measured by inhibition of the

peptide substrates. To measure the protein kinase inhibition activity of the

15 compounds, the following constructs were devised.

VEGF-R2 Construct for Assay: This construct determines the ability of a test

compound to inhibit tyrosine kinase activity. A construct (VEGF-R2Δ50) of the

cytosolic domain of human vascular endothelial growth factor receptor 2 (VEGF-R2)

lacking the 50 central residues of the 68 residues of the kinase insert domain was

20 expressed in a baculovirus/insect cell system. Of the 1356 residues of full-length

VEGF-R2, VEGF-R2Δ50 contains residues 806-939 and 990-1171, and also one

340

point mutation (E990V) within the kinase insert domain relative to wild-type VEGF-

R2. Autophosphorylation of the purified construct was performed by incubation of

the enzyme at a concentration of 4 μM in the presence of 3 mM ATP and 40 mM

MgCl$_2$ in 100 mM HEPES, pH 7.5, containing 5% glycerol and 5 mM DTT, at 4 °C

5　　for 2 h. After autophosphorylation, this construct has been shown to possess catalytic

activity essentially equivalent to the wild-type autophosphorylated kinase domain

construct. See Parast et al., *Biochemistry*, 37, 16788-16801 (1998).

　　　　FGF-R1 Construct for Assay: The intracellular kinase domain of human FGF-

R1 was expressed using the baculovirus vector expression system starting from the

10　　endogenous methionine residue 456 to glutamate 766, according to the residue

numbering system of Mohammadi et al., *Mol. Cell. Biol.*, 16, 977-989 (1996). In

addition, the construct also has the following 3 amino acid substitutions: L457V,

C488A, and C584S.

　　　　LCK Construct for Assay: The LCK tyrosine kinase was expressed in insect

15　　cells as an N-terminal deletion starting from amino acid residue 223 to the end of the

protein at residue 509, with the following two amino acid substitutions at the N-

terminus: P233M and C224D.

　　　　CHK1 Construct for Assay: C-terminally His-tagged full-length human CHK1

(FL-CHK1) was expressed using the baculovirus/insect cell system. It contains 6

20　　histidine residues (6 x His-tag) at the C-terminus of the 476 amino acid human CHK1.

The protein was purified by conventional chromatographic techniques.

　　　　CDK2/Cyclin A Construct for Assay: CDK2 was purified using published

methodology (Rosenblatt et al., *J. Mol. Biol.*, 230, 1317-1319 (1993)) from insect

cells that had been infected with a baculovirus expression vector. Cyclin A was purified from *E. coli* cells expressing full-length recombinant cyclin A, and a truncated cyclin A construct was generated by limited proteolysis and purified as described previously (Jeffrey et al., *Nature*, 376, 313-320 (1995)).

5   CDK4/Cyclin D Construct for Assay: A complex of human CDK4 and cyclin D3, or a complex of cyclin D1 and a fusion protein of human CDK4 and glutathione-S-transferase (GST-CDK4), was purified using traditional biochemical chromatographic techniques from insect cells that had been co-infected with the corresponding baculovirus expression vectors.

10   FAK Construct for Assay. The catalytic domain of human FAK (FAKcd409) was expressed using the baculovirus vector expression system. The 280 amino acid domain expressed comprises residues methionine 409 to glutamate 689. One amino acid substitution exists (P410T) relative to the sequence assession number L13616 published by Whithey, G.S. et al., *DNA Cell Biol*, 9, 823-30 (1993). The protein was

15   purified using classical chromatography techniques.

TIE-2 (TEK) Construct for Assay

The TIE-2 tyrosine kinase domain was expressed in insect cells as an N-terminal deletion starting from amino acid residue 774 to the end of the protein at residue 1124. This construct also carries a R774M mutation, which serves as the

20   initiating methionine residue in translation.

<u>VEGF-R2 Assay</u>

<u>Coupled Spectrophotometric (FLVK-P) Assay</u>

The production of ADP from ATP that accompanies phosphoryl transfer was

coupled to oxidation of NADH using phosphoenolpyruvate (PEP) and a system having

5   pyruvate kinase (PK) and lactic dehydrogenase (LDH). The oxidation of NADH was

monitored by following the decrease of absorbance at 340 nm ($e_{340} = 6.22$ cm^{-1} mM^{-1})

using a Beckman DU 650 spectrophotometer. Assay conditions for phosphorylated

VEGF-R2Δ50 (indicated as FLVK-P in the tables below) were the following: 1 mM

PEP; 250 μM NADH; 50 units of LDH/mL; 20 units of PK/mL; 5 mM DTT; 5.1 mM

10   poly(E_4Y_1); 1 mM ATP; and 25 mM MgCl$_2$ in 200 mM HEPES, pH 7.5. Assay

conditions for unphosphorylated VEGF-R2Δ50 (indicated as FLVK in the tables) were

the following: 1 mM PEP; 250 μM NADH; 50 units of LDH/mL; 20 units of PK/mL;

5 mM DTT; 20 mM poly(E_4Y_1); 3 mM ATP; and 60 mM MgCl$_2$ and 2 mM MnCl$_2$ in

200 mM HEPES, pH 7.5. Assays were initiated with 5 to 40 nM of enzyme. K_i

15   values were determined by measuring enzyme activity in the presence of varying

concentrations of test compounds. The data were analyzed using Enzyme Kinetic and

Kaleidagraph software.

      <u>ELISA Assay</u>

      Formation of phosphogastrin was monitored using biotinylated gastrin peptide

20   (1-17) as substrate. Biotinylated phosphogastrin was immobilized using streptavidin

coated 96-well microtiter plates followed by detection using anti-phosphotyrosine-

antibody conjugated to horseradish peroxidase. The activity of horseradish peroxidase

was monitored using 2,2'-azino-di-[3-ethylbenzathiazoline sulfonate(6)] diammonium

343

salt (ABTS). Typical assay solutions contained: 2 μM biotinylated gastrin peptide; 5

mM DTT; 20 μM ATP; 26 mM $MgCl_2$; and 2 mM $MnCl_2$ in 200 mM HEPES, pH

7.5. The assay was initiated with 0.8 nM of phosphorylated VEGF-R2Δ50.

Horseradish peroxidase activity was assayed using ABTS, 10 mM. The horseradish

5　peroxidase reaction was quenched by addition of acid (H_2SO_4), followed by

absorbance reading at 405 nm. K_i values were determined by measuring enzyme

activity in the presence of varying concentrations of test compounds. The data were

analyzed using Enzyme Kinetic and Kaleidagraph software.

FGF-R Assay

10　　　　The spectrophotometric assay was carried out as described above for VEGF-R2,

except for the following changes in concentration: FGF-R = 50 nM, ATP = 2 mM,

and poly(E4Y1) = 15 mM.

LCK Assay

　　　　The spectrophotometric assay was carried out as described above for VEGF-R2,

15　except for the following changes in concentration: LCK = 60 nM, $MgCl_2$ = 0 mM,

poly(E4Y1) = 20 mM.

CHK1 Assay

　　　　The production of ADP from ATP that accompanies phosphoryl transfer to the

synthetic substrate peptide Syntide-2 (PLARTLSVAGLPGKK) was coupled to

20　oxidation of NADH using phosphoenolpyruvate (PEP) through the actions of pyruvate

kinase (PK) and lactic dehydrogenase (LDH). The oxidation of NADH was monitored

by following the decrease of absorbance at 340 nm ($\in 340 = 6.22$ cm^{-1} mM^{-1}) using a

HP8452 spectrophotometer. Typical reaction solutions contained: 4 mN PEP; 0.15

mM NADH; 28 units of LDH/mL; 16 units of PK/mL; 3 mM DTT; 0.125 mM

Syntide-2; 0.15 mM ATP; 25 mM MgCl$_2$ in 50 mM TRIS, pH 7.5; and 400 mM

NaCl. Assays were initiated with 10 nM of FL-CHK1. K_i values were determined by

measuring initial enzyme activity in the presence of varying concentrations of test

5   compounds. The data were analyzed using Enzyme Kinetic and Kaleidagraph

software.

CDK2/Cyclin A and CDK4/Cyclin D Assays

Cyclin-dependent kinase activity was measured by quantifying the enzyme-

catalyzed, time-dependent incorporation of radioactive phosphate from [^{32}P]ATP

10   into a recombinant fragment of the retinoblastoma protein. Unless noted otherwise,

assays were performed in 96-well plates in a total volume of 50 μL, in the presence of

10 mM HEPES (N-[2-hydroxyethyl]piperazine-N'-[2-ethanesulfonic acid]) (pH 7.4),

10 mM MgCl$_2$, 25 μM adenosine triphosphate (ATP), 1 mg/mL ovalbumin, 5 μg/mL

leupeptin, 1 mM dithiothreitol, 10 mM β-glycerophosphate, 0.1 mM sodium

15   vanadate, 1 mM sodium fluoride, 2.5 mM ethylene glycol-bis(β-aminoethyl ether)-

N,N,N'N'-tetraacetic acid (EGTA), 2% (v/v) dimethylsulfoxide, and 0.03 - 0.2 μCi

[^{32}P]ATP. The substrate (0.3-0.5 μg) was purified recombinant retinoblastoma

protein fragment (Rb) (residues 386-928 of the native retinoblastoma protein; 62.3

kDa, containing the majority of the phosphorylation sites found in the native 106-kDa

20   protein, as well as a tag of six histidine residues for ease of purification). Reactions

were initiated with CDK2 (150 nM CDK2/Cyclin A complex) or CDK4 (50 nM

CDK4/Cyclin D3 complex), incubated at 30 °C, and terminated after 20 minutes

(min.) by the addition of ethylenediaminetetraacetic acid (EDTA) to 250 mM. The

phosphorylated substrate was then captured on a nitrocellulose membrane using a 96-

well filtration manifold, and unincorporated radioactivity was removed by repeated

washing with 0.85% phosphoric acid. Radioactivity was quantified by exposing the

dried nitrocellulose membranes to a phosphorimager. Apparent K_i values were

5   measured by assaying enzyme activity in the presence of different compound

concentrations and subtracting the background radioactivity measured in the absence

of enzyme. The kinetic parameters (kcat, Km for ATP) were measured for each

enzyme under the usual assay conditions by determining the dependence of initial

rates on ATP concentration. The data were fit to an equation for competitive

10   inhibition using Kaleidagraph (Synergy Software), or were fit to an equation for

competitive tight-binding inhibition using the software KineTic (BioKin, Ltd.).

Measured K_i values for known inhibitors against CDK4 and CDK2 agreed with

published IC_{50} values. The specific activity of CDK4 was the same whether

complexed to full-length cyclin D3 or the truncated Cyclin D3 construct; both

15   complexes also yielded very similar K_i values for selected inhibitors.

FAK Assay

FAK HTS utilized the fluorescence polarization assay provided by LJL

Biosystems. The kinase reaction contained: 100mM Hepes pH 7.5, 10mM MgCl$_2$,

1mM DTT, 1mM ATP, and 1mg/ml poly Glu-Tyr (4:1). The reaction is initiated by

20   the addition of 5nM FAKcd409. The reaction is terminated by the addition of EDTA

followed by addition of fluor-labelled peptide and anti-phosphotyrosine antibody,

both provided by LJL Biosystems. Inhibition results are read on a Analyst (LJL)

detector.

TIE-2 Spectrophotometric Assay

The kinase-catalyzed production of ADP from ATP that accompanies

phosphoryl transfer to the random copolymer poly(Glu$_4$Tyr) was coupled to the

oxidation of NADH through the activities of pyruvate kinase (PK) and lactate

dehydrogenase (LDH). NADH conversion to NAD$^+$ was monitored by the decrease

5   in absorbance at 340 nm (ε = 6.22 cm^{-1}mM^{-1}) using a Beckman DU650

spectrophotometer. Typical reaction solutions contained 1 mM

phosphoenolpyruvate, 0.24 mM NADH, 40 mM MgCl$_2$, 5 mM DTT, 2.9 mg/mL

poly(Glu$_4$Tyr), 0.5 mM ATP, 15 units/mL PK, 15 units/mL LDH in 100 mM HEPES,

pH 7.5. Assays were initiated with the addition of 4 to 12 nM phosphorylated Tie-2

10   (aa 775-1122). Percent inhibition was determined in triplicate at a 1 μM level of

inhibitor.

TIE-2 DELFIA Assay

Formation of phosphotyrosine was monitored using biotinylated p34cdc2 (aa6-

20 = KVEKIGEGTYGVVYK) peptide as substrate. Biotinylated peptide was

15   immobilized using NeutrAvidin™ coated 96-well microtiter plates followed by

detection using anti-phosphotyrosine-antibody (PY20) conjugated to europium N1

chelate. Typical assay solutions contained: 1 μM biotinylated p34cdc2 peptide, 150

μM ATP, 5 mM MgCl$_2$, 1 mM DTT, 0.01% BSA, 5% glycerol, 2% DMSO, 25 mM

HEPES pH 7.5. The assay was initiated in the NeutrAvidin plate with 50 nM of TIE2

20   intracellular domain. The kinase reaction was terminated with 50 mM EDTA. Plates

were then washed, and europium antibody added. After incubation, they were again

washed, and DELFIA™ Enhancement Solution added. Plates were read at standard

Europium time-resolved settings (ex 340 nm, em 615 nm, delay 400 μsec, window

400 μsec). Per cent inhibition was calculated with reference to intraplate wells which

had added DMSO rather than compound in DMSO, with background subtracted from

both experimental and control with reference to an intraplate well which had EDTA

added prior to addition of enzyme.

5   HUVEC Proliferation Assay

This assay determines the ability of a test compound to inhibit the growth

factor-stimulated proliferation of human umbilical vein endothelial cells

("HUVEC"). HUVEC cells (passage 3-4, Clonetics, Corp.) were thawed into

EGM2 culture medium (Clonetics Corp) in T75 flasks. Fresh EGM2 medium was

10   added to the flasks 24 hours later. Four or five days later, cells were exposed to

another culture medium (F12K medium supplemented with 10% fetal bovine

serum (FBS), 60 μg/mL endothelial cell growth supplement (ECGS), and 0.1

mg/mL heparin). Exponentially-growing HUVEC cells were used in experiments

thereafter. Ten to twelve thousand HUVEC cells were plated in 96-well dishes in

15   100 μl of rich, culture medium (described above). The cells were allowed to

attach for 24 hours in this medium. The medium was then removed by aspiration

and 105 μl of starvation media (F12K+1% FBS) was added to each well. After 24

hours, 15 μl of test agent dissolved in 1% DMSO in starvation medium or this

vehicle alone was added into each treatment well; the final DMSO concentration

20   was 0.1%. One hour later, 30 μl of VEGF (30 ng/mL) in starvation media was

added to all wells except those containing untreated controls; the final VEGF

concentration was 6 ng/mL. Cellular proliferation was quantified 72 hours later by

MTT dye reduction, at which time cells were exposed for 4 hours MTT (Promega

Corp.). Dye reduction was stopped by addition of a stop solution (Promega Corp.) and absorbance at 595 λ was determined on a 96-well spectrophotometer plate reader.

IC$_{50}$ values were calculated by curve-fitting the response of A^{595} to various

5 concentrations of the test agent; typically, seven concentrations separated by 0.5 log were employed, with triplicate wells at each concentration. For screening compound library plates, one or two concentrations (one well per concentration) were employed, and the % inhibition was calculated by the following formula:

% inhibition = (control − test) ÷ (control − starvation)

10 where

control = A^{595} when VEGF is present without test agent

test = A^{595} when VEGF is present with test agent

starvation = A^{595} when VEGF and test agent are both absent.

Cancer Cell Proliferation (MV522) Assay

15 The protocol for assessing cellular proliferation in cancer cells is similar to that used for assessments in HUVEC cells. Two thousand lung cancer cells (line MV522, acquired from American Tissue Cultural Collection) were seeded in growth media (RPMI1640 medium supplemented with 2 mM glutamine and 10% FBS). Cells are allowed to attach for 1 day prior to addition of test agents and /or

20 vehicles. Cells are treated simultaneously with the same test agents used in the HUVEC assay. Cellular proliferation is quantified by MTT dye reduction assay 72 hours after exposure to test agents. The total length of the assay is 4 days vs. 5 for HUVEC cells because MV522 cells are not exposed to starvation medium.

Mouse PK Assay

The pharmacokinetics (e.g., absorption and elimination) of drugs in mice were

analyzed using the following experiment. Test compounds were formulated as a

solution or suspension in a 30:70 (PEG 400: acidified H_2O) vehicle or as a suspension

5   in 0.5% CMC. This was administered orally (p.o.) and intraperitoneally (i.p.) at

variable doses to two distinct groups (n=4) of B6 female mice. Blood samples were

collected via an orbital bleed at time points: 0 hour (pre-dose), 0.5 h, 1.0 h, 2.0 h,

and 4.0 h, and 7.0 h post dose. Plasma was obtained from each sample by

centrifugation at 2500 rpm for 5 min. Test compound was extracted from the plasma

10   by an organic protein precipitation method. For each time bleed 50 μL of plasma was

combined with 1.0 mL of acetonitrile, vortexed for 2 min. and then spun at 4000 rpm

for 15 min. to precipitate the protein and extract out the test compound. Next, the

acetonitrile supernatant (the extract containing test compound) was poured into new

test tubes and evaporated on a hot plate (25 °C) under a steam of N_2 gas. To each

15   tube containing the dried test compound extract 125 μL of mobile phase (60:40,

0.025 M $NH_4H_2PO_4$ +2.5 mL/L TEA:acetonitrile) was added. The test compound was

resuspended in the mobile phase by vortexing and more protein was removed by

centrifugation at 4000 rpm for 5 min. Each sample was poured into an HPLC vial for

test compound analysis on an Hewlett Packard 1100 series HPLC with UV detection.

20   From each sample, 95 μL was injected onto a Phenomenex-Prodigy reverse phase C-

18, 150 x 3.2 mm column and eluted with a 45-50% acetonitrile gradient run over 10

min. Test-compound plasma concentrations (μg/mL) were determined by a

comparison to standard curve (peak area vs. conc. μg/mL) using known

concentrations of test compound extracted from plasma samples in the manner

described above. Along with the standards and unknowns, three groups (n=4) of

quality controls (0.25 µg/mL, 1.5 µg/mL, and 7.5 µg/mL) were run to insure the

consistency of the analysis. The standard curve had an R2> 0.99 and the quality

5   controls were all within 10 % of their expected values. The quantitated test samples

were plotted for visual display using Kalidagraph software and their pharmacokinetic

parameters were determined using WIN NONLIN software. Example 1(a) provided

the following results: 0.69 (Mouse pK, AUC, ip, µg-h/ml); 0.33 (Mouse pK, AUC,

po, µg-h/ml).

10   Human Liver Microsome (HLM) Assay

Compound metabolism in human liver microsomes was measured by LC-MS

analytical assay procedures as follows. First, human liver microsomes (HLM) were

thawed and diluted to 5 mg/mL with cold 100 mM potassium phosphate (KPO4)

buffer. Appropriate amounts of KPO4 buffer, NADPH-regenerating solution

15   (containing B-NADP, glucose-6-phosphate, glucose-6-phosphate dehydrogenase, and

MgCl$_2$), and HLM were preincubated in 13 x 100 mm glass tubes at 37 C for 10 min.

(3 tubes per test compound--triplicate). Test compound (5 µM final) was added to

each tube to initiate reaction and was mixed by gentle vortexing, followed by

incubation at 37 °C. At t=0, 2 h, a 250-µL sample was removed from each incubation

20   tube to separate 12 x 75 mm glass tubes containing 1 mL ice-cold acetonitrile with

0.05 µM reserpine. Samples were centrifuged at 4000 rpm for 20 min. to precipitate

proteins and salt (Beckman Allegra 6KR, S/N ALK98D06, #634). Supernatant was

transferred to new 12 x 75 mm glass tubes and evaporated by Speed-Vac centrifugal

351

vacuum evaporator. Samples were reconstituted in 200 μL 0.1% formic

acid/acetonitrile (90/10) and vortexed vigorously to dissolve. The samples were then

transferred to separate polypropylene microcentrifuge tubes and centrifuged at 14000

x g for 10 min. (Fisher Micro 14, S/N M0017580). For each replicate (#1-3) at each

5   timepoint (0 and 2 h), an aliquot sample of each test compound was combined into a

single HPLC vial insert (6 total samples) for LC-MS analysis, which is described

below.

The combined compound samples were injected into the LC-MS system,

composed of a Hewlett-Packard HP1100 diode array HPLC and a Micromass Quattro

10   II triple quadruple mass spectrometer operating in positive electrospray SIR mode

(programmed to scan specifically for the molecular ion of each test compound. Each

test compound peak was integrated at each timepoint. For each compound, peak area

at each timepoint (n=3) was averaged, and this mean peak area at 2 h was divided by

the average peak area at time 0 hour to obtain the percent test compound remaining at

15   2 h.

The results of the testing of the compounds using various assays are

summarized in the table below, where a notation of "% @" indicates the percent

inhibition at the stated concentration, "*" values represent Ki (nM) or % inhibition

at a compound concentration of 1 μM for * or 50 nM for **, unless otherwise

20   indicated. "NT" indicates no significant inhibition

5   LIBRARY EXAMPLE I
10   The three library building blocks ("amine templates") 6-(3-aminophenoxy)-3-

E-styryl-1H-indazole (Y = O), 6-(3-aminobenzoyl)-3-E-styryl-1H-indazole (Y = CO),

and 6-(3-aminophenyl)amino-3-E-styryl-1H-indazole (Y = NH) were prepared as

described in Example 7, Example 18, and Example 46 respectively. 0.1 M solutions

of the acid, the amine template, o-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetra-

15   methyluronium hexafluorophosphate and triethylamine were prepared separately in

anhydrous DMF. To each tube in an array of 8X11 culture tubes (10x75 mm) was

added 105 μL (0.0105 mmol) of a different acid. To this was added 100 μL (0.01

mmol) of the amine solution, 105 μL (0.0105 mmol) of the triethylamine solution
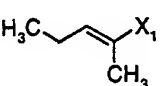

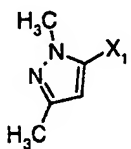

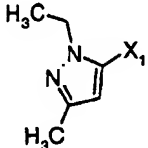

followed by 105 μL (0.0105 mmol) of the *o*-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetra-methyluronium hexafluorophosphate solution. The reactions were stirred in a heating block at 50 °C for 3 h. The reaction mixtures were transferred to a 1 mL 96-well plate using a liquid handler. The solvents were removed using the SpeedVac™

5   apparatus and the crude reaction mixtures were redissolved in DMSO to give a final theoretical concentration of 10 mM.
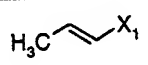

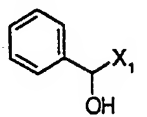

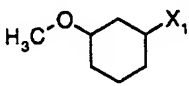

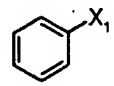

The compounds in the table were tested for inhibition of the proliferation of HUVEC at a nominal concentration of 10 nM, and the results are listed in Table I below, calculated from:

10   % inhibition = (control-treated)/(control-starvation) x 100

Under these testing conditions, >50% inhibition is considered significant.

LIBRARY EXAMPLE II

(a)   When Y = S in Formula I
. 6-[2-(Pentafluorophenoxycarbonyl)phenylsulfanyl]-3-E-[2-(pyridin-2-

yl)ethenyl]-1H–indazole (Y = S) was prepared as decribed in Example 35(a).

Solutions of 261 amines (1.5 μmol), and Et$_3$N (0.1393 μL, 1.0 μmol), dissolved in

DMF (15 μL), were distributed in to the wells of a 96-well plate. In cases where the

amine was used as a hydrochloride salt, additional Et$_3$N (0.4179 μL, 3.0 μmol) was

added to liberate the free base. Each of the wells was treated with a solution of

pentafluorophenyl ester (0.5395 mg, 1.0 μmol) dissolved in DMF (30 μL), then

agitated for 24 h at room temperature. The crude reaction mixtures were concentrated

using a GeneVac™ apparatus, and then diluted with DMSO to a final concentration of

10 mM.

(b)   When Y = NH in Formula I
Solutions of 263 amines (2.0 μmol), and Et$_3$N (0.4181 μL, 3.0 μmol) were

dissolved in DMF (20 μL) and distributed into the wells of a 96-well plate. In cases

where the amine was used as a hydrochloride salt, additional Et$_3$N (0.5575 μL, 4.0

μmol) was added to liberate the free base. Each of the wells were treated with a

solution of: 6-[2-carboxyphenyl-amino]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole

(0.447 mg, 0.75 µmol) dissolved in DMF (20 µL), followed by a solution of HATU

(0.570 mg, 1.5 µmol) dissolved in DMF (10 µL), and then agitated for 72 h at room

temperature. The crude reaction mixtures were concentrated using a GeneVac^{TM}

apparatus, and then diluted with DMSO to a final concentration of 10 mM.

The compounds in the Library Table II were tested for inhibition of the

proliferation of HUVEC at a nominal concentration of 0.5 and 2 nM for Y = S, and

the results are listed in below, as calculated from:

$$\% \text{ inhibition} = (\text{control-treated})/(\text{control-starvation}) \times 100$$

Under these testing conditions, >50% inhibition is considered significant.

LIBRARY EXAMPLE III
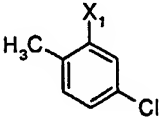

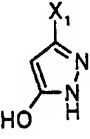

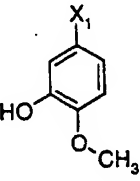

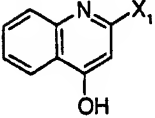

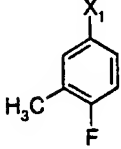

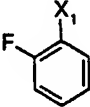

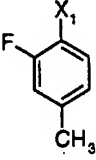

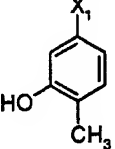

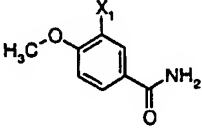

0.1 M solutions of the amines, triethylamine and 4-dimethylaminopyridine

were prepared separately in anhydrous DMF and transferred to a glovebox. 0.1 M

solution of 6-[2-(carboxy)phenylsulfanyl]-3-E-[2-(pyridin-2-yl)ethenyl]-1H-indazole,

Example 33(g), tetrabutylammonium salt and o-(7-azabenzotriazol-1-yl)-N,N,N',N'-

tetra-methyluronium hexafluorophosphate was prepared in the glovebox. To each

tube in an array of 8X11 culture tubes (10x75 mm) in the golvebox was added 100 μL

(0.01 mmol) of the different amine solutions followed by the addition of 100 μL (0.01

mmol) tetrabutylammonium2-{3-[(E)-2-(2-pyridinyl)ethylyl]-1H-indazol-6-

yl}sulfanyl)benzoate solution, 100 μL (0.01 mmol) of the triethylamine solution, 100

μL (0.01 mmol) of the 4-dimethylaminopyridine solution and 100 μL (0.01 mmol) of

the o-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetra-methyluronium hexafluorophosphate

solution. The reactions were stirred in a heating block at 50 °C for 1 h. The reaction

mixtures were transferred to a 1 mL 96-well plate using a liquid handler. The solvents

were removed using the SpeedVac™ apparatus and the crude reaction mixtures were

redissolved in DMSO to give a final theoretical concentration of 10 mM.
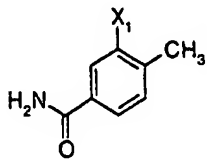

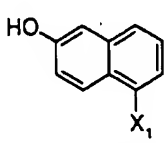

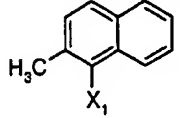

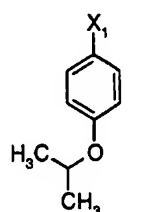

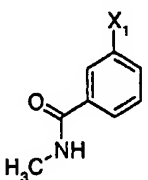

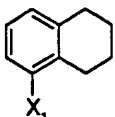

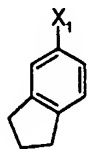

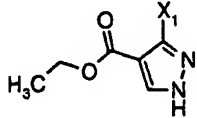

The compounds in the table were tested for inhibition of the proliferation of HUVEC at a nominal concentration of 0.5 nM, and the results are listed in Table III below, as calculated from:
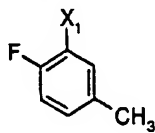

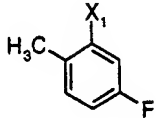

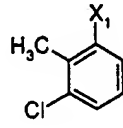

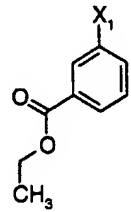

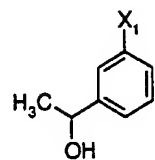

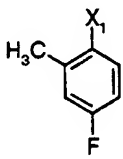

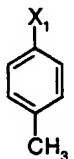

% inhibition = (control-treated)/(control-starvation) x 100
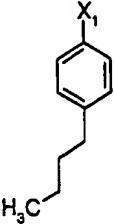

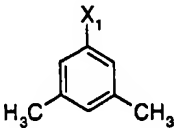

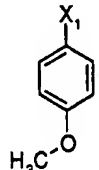

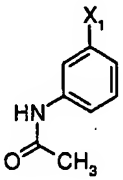

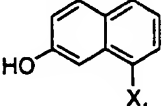

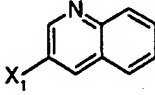

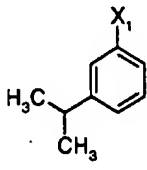

Under these testing conditions, >30% inhibition is considered significant.

values in bold refer to spectrophotometric assay results; non-bolded values were

obtained in a DELFIA assay

5   Determination of Inhibitor Concentration in Mouse Plasma after Intraperitoneal
and Oral Dosing

The dosing solution consisted of the inhibitor dissolved in one of the

following vehicles: either 30% or 60% aqueous polypropylene glycol solution with a

10   molar equivalent of HCl in water, or 0.5% carboxymethylcellulose in water. The

final concentration was normally 5 mg/ml with a dosing volume of 5 or 10 ml/kg.

Taconic (Germantown, NY) female mice were dosed as a function of compound mass

per body mass, usually 50 or 25 mg/kg. Blood collection was via ocular bleed at 0.5,

1, 4 hr with the final time point, 7 hour, via intracardiac puncture. The blood was

15   centrifuged to collect plasma, which was then stored at −80 °C until analysis.

Samples were prepared for analysis using an internal standard and sodium hydroxide.

After vortexing, ethyl acetate was added and mixed for 15-20 minutes at ambient

temperature. Following centrifugation, the resulting organic layer was evaporated

and subsequently reconstituted in acetonitrile and buffer. The samples were then

20   analyzed via HPLC or LC-MS.

Compound levels were quantitated by generating a standard curve of known

compound concentration in mouse plasma. Compound levels were plotted as a

function of time and analyzed to provide area under the concentration curve (AUC

416

ng*hr/ml), maximum concentration (Cmax ng/ml), minimum concentration (Cmin or

7 hour trough ng/ml), and terminal half-life (T1/2 hr). The results are shown in Table

6.

<u>*In Vivo* Assay of Retinal Vascular Development in Neonatal Rats</u>

The development of the retinal vascular in rats occurs from postnatal day

1 to postnatal day 14 (P1-P14). This process is dependent on the activity of VEGF

5   (J. Stone, et al, *J. Neurosci.*, 15, 4738 (1995)). Previous work has demonstrated

that VEGF also acts as a survival factor for the vessels of the retina during early

vascular development (Alon, et. al, *Nat. Med.*, 1, 1024 (1995)). To assess the

ability of specific compounds to inhibit the activity of VEGF *in vivo*, compounds

were formulated in an appropriate vehicle, usually 50% polyethylene glycol,

average molecular weight 400 daltons, and 50% solution of 300 mM sucrose in

5   deionized water. Typically, two microliters (2 µl) of the drug solution was

injected into the midvitreous of the eye of rat pups on postnatal day 8 or 9. Six

days after the intravitreal injection, the animals were sacrificed and the retinas

dissected free from the remaining ocular tissue. The isolated retinas were then

subjected to a histochemical staining protocol that stains endothelial cells

10   specifically (Lutty and McLeod, *Arch. Ophthalmol.*, 110, 267 (1992)), revealing

the extent of vascularization within the tissue sample. The individual retinas are

then flat-mount onto glass slides and examined to determine the extent of

vascularization. Effective compounds inhibit the further development of the

retinal vasculature and induce a regression of all but the largest vessels within the

15   retina. The amount of vessel regression was used to assess the relative potency of

the compounds after in vivo administration. Vessel regression is graded on

subjective scale of one to three pluses, with one plus being detectable regression

judged to be approximately 25 percent or less, two pluses being judged to be

approximately 25-75 % regression and three pluses give to retinas with near total

20   regression (approximately 75% or greater).

For more quantitative analysis of regression, images of ADPase-stained,

flat-mounted retinas were captured with a digital camera attached to a dissecting

microscope. Retinal images were then imported into an image analysis software

(Image Pro Plus 4.0, Media Cybernetics, Silver Spring, MD). The software was employed to determine the percentage of the area of the retina that contained stained vessels. This value for the experimental eye was compared to that measured for the vehicle injected, contralateral eye from the same animal. The

5   reduction in the vascular area seen in the eye that received compound as compared to the vehicle-injected eye was then expressed as the "percent regression" for that sample. Percent regression values were averaged for groups of 5-8 animals.

In samples in which observation through the microscope indicated near

10   total regression, a percent regression value of 65-70% was routinely measured. This was due to stain deposits within folds of retina, folds that were induced by the vehicle used for drug injection. The image analysis software interpreted these stain-containing folds as vessels. No attempt was made to correct for these folds since they varied from eye to eye. Thus, it should be noted that the percent

15   regression values reported result from a conservative measurement that accurately rank orders compounds, but underestimates their absolute potency.

In Vivo Assay of Retinal Vascular Development in Neonatal Rat Model of

Retinopathy of Prematurity

A second model of VEGF dependent retinal neovascularization was employed

20   to evaluate the activities of this series of compounds. In this model (Penn et. al, *Invest. Ophthalmol. Vis. Sci.*, 36, 2063, (1995)), rats pups (n=16) with their mother are placed in a computer controlled chamber that regulates the concentration of oxygen. The animals are exposed for 24 hours to a concentration of 50% oxygen

followed by 24 hours at a concentration of 10% oxygen. This alternating cycle of

hyperoxia followed by hypoxia is repeated 7 times after which the animals are

removed to room air (P14). Compounds are administered via intravitreal injection

upon removal to room air and the animals are sacrificed 6 days later (P20). The

5   isolated retinas are then isolated, stained mounted and analyzed as detail above in the

development model. The effectiveness was also graded as is described for the

development model.

Phosphorylase Kinase

Phosphorylase Kinase Construct for Assay.

The truncated catalytic subunit (gamma subunit) of phosphorylase kinase

5   (amino acids 1-298) was expressed in E.coli and isolated from inclusion bodies.

Phosphorylase kinase was then refolded and stored in glycerol at –20 °C.

Phosphorylase Kinase Assay. In the assay, the purified catalytic subunit is

used to phosphorylate phosphorylase b using radiolabled ATP. Briefly, 1.5 mg/ml of

426

phosphorylase b is incubated with 10 nM phosphorylase kinase in 10 mM $MgCl_2$, 50

mM Hepes pH 7.4, at 37 °C. The reaction is started with the addition of ATP to 100

uM and incubated for 15 min at 25 °C or 37 °C. The reaction was terminated and

proteins were precipitated by the addition of TCA to 10% final concentration. The

5   precipitated proteins were isolated on a 96 well Millipore MADP NOB filter plate.

The filter plate was then extensively washed with 20% TCA, and dried. Scintilation

fluid was then added to the plate and incorporated radiolabel was counted on a

Wallac microbeta counter. The % inhibition of phosphoryl transfer from ATP to

phosphorylase b in the presence of 10 μM of compound is shown in the Table 8

10   below.

TABLE 8

Example #	% Inhibition @ 10 μM
52(b)	92
27(f)	90
27(a)	37

The exemplary compounds described above may be formulated into

pharmaceutical compositions according to the following general examples.

15   Example 1: Parenteral Composition

To prepare a parenteral pharmaceutical composition suitable for administration

by injection, 100 mg of a water-soluble salt of a compound of Formula I is dissolved

in DMSO and then mixed with 10 mL of 0.9% sterile saline. The mixture is

incorporated into a dosage unit form suitable for administration by injection.

427

Example 2: Oral Composition

To prepare a pharmaceutical composition for oral delivery, 100 mg of a

compound of Formula I is mixed with 750 mg of lactose. The mixture is incorporated

into an oral dosage unit for, such as a hard gelatin capsule, which is suitable for oral

5   administration.

Example 3: Intraocular Composition

To prepare a sustained-release pharmaceutical composition for intraocular

delivery, a compound of Formula I is suspended in a neutral, isotonic solution of

hyaluronic acid (1.5% conc.) in phosphate buffer (pH 7.4) to form a 1% suspension.

10   It is to be understood that the foregoing description is exemplary and

explanatory in nature, and is intended to illustrate the invention and its preferred

embodiments. Through routine experimentation, the artisan will recognize

apparent modifications and variations that may be made without departing from

the spirit of the invention. Thus, the invention is intended to be defined not by the

15   above description, but by the following claims and their equivalents.

CLAIMS

What is claimed is:

1.   A compound of the Formula I:
I

5   wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3 where R^3 is a substituted or unsubstituted

alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl; and

R^2 is a substituted or unsubstituted aryl, heteroaryl, or Y-X, where Y is O,

10   S, C=CH$_2$, C=O, S=O, SO$_2$, alkylidene, NH, or N-(C$_1$-C$_8$ alkyl), and X is

substituted or unsubstituted Ar, heteroaryl, NH-(alkyl), NH-(cycloalkyl), NH-

(heterocycloalkyl), NH(aryl), NH(heteroaryl), NH-(alkoxyl), or NH-

(dialkylamide), where Ar is aryl;

or a pharmaceutically acceptable prodrug, pharmaceutically active

15   metabolite, or pharmaceutically acceptable salt thereof.

2.   A compound of the Formula I(a):

I(a)

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl; and

R^2 is a substituted or unsubstituted aryl or Y-Ar, where Y is O, S, C=CH$_2$,

5   C=O, S=O, SO$_2$, CH$_2$, CHCH$_3$, NH, or N-(C$_1$-C$_8$ alkyl), and Ar is a substituted or

unsubstituted aryl;

or a pharmaceutically acceptable prodrug, pharmaceutically active

metabolite, or pharmaceutically acceptable salt thereof.
3.   A compound of the Formula II:

II

10   wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

R^4 and R^7 are each independently hydrogen, OH, halo, C$_1$-C$_8$ alkyl, C$_1$-C$_8$

15   alkoxy, C$_1$-C$_8$ alkenyl, aryloxy, thioaryl, CH$_2$-OH, CH$_2$-O- (C$_1$-C$_8$ alkyl), CH$_2$-O-

aryl, CH$_2$-S-(C$_1$-C$_8$ alkyl), or CH$_2$-S-aryl;

R^5 and R^6 are each independently hydrogen, OH, halo, Z-alkyl, Z-aryl, or

Z-CH$_2$CH=CH$_2$, where Z is O, S, NH, or CH$_2$, and the alkyl and aryl moiety of Z-

alkyl and Z-aryl are each optionally substituted;

or a pharmaceutically acceptable prodrug, pharmaceutically active

metabolite, or pharmaceutically acceptable salt thereof.

4. A compound, pharmaceutically acceptable prodrug, pharmaceutically

active metabolite, or pharmaceutically acceptable salt according to claim 3,

5   wherein:

R^1 is a substituted or unsubstituted bicyclic heteroaryl, or a group of the

formula CH=CH—R^3 where R^3 is a substituted or unsubstituted aryl or heteroaryl;

R^4 and R^7 are each independently hydrogen or C_1-C_8 alkyl; and

R^5 and R^6 are each independently halo, Z-alkyl, or Z-CH$_2$CH=CH$_2$, where

10   Z is O or S and alkyl is optionally substituted.

5.   A compound of the Formula III:

III

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

15   formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

Y is O, S, C=CH$_2$, C=O, S=O, SO$_2$, CH$_2$, CHCH$_3$, NH, or N-(C_1-C_8 alkyl);

R^8 is a substituted or unsubstituted alkyl, alkenyl, cycloalkyl,

heterocycloalkyl, aryl, heteroaryl, alkoxyl, or aryloxyl;

20   R^{10} is independently selected from hydrogen, halogen, and lower-alkyl;

431

or a pharmaceutically acceptable prodrug, pharmaceutically active

metabolite, or pharmaceutically acceptable salt thereof.

6.   A compound, pharmaceutically acceptable prodrug,

pharmaceutically active metabolite, or pharmaceutically acceptable salt according
5   to claim 5, wherein:

R^1 is a substituted or unsubstituted bicyclic heteroaryl, or a group of the

formula CH=CH—R^3 where R^3 is a substituted or unsubstituted aryl or heteroaryl;

Y is O, S, C=CH_2, C=O, NH, or N-(C_1-C_8 alkyl); $\overline{R^8}$ is a substituted or

unsubstituted aryl or heteroaryl, alkyl, and alkenyl, and R^{10} is hydrogen or

10   halogen.

7.   A compound of the Formula III(a):

III(a)

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

15   formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

Y is O, S, C=CH_2, C=O, S=O, SO_2, CH_2, $CHCH_3$, NH, or N-(C_1-C_8 alkyl);

R^8 is a substituted or unsubstituted alkyl, alkenyl, cycloalkyl,

heterocycloalkyl, aryl, heteroaryl, alkoxyl, or aryloxyl;

20   or a pharmaceutically acceptable prodrug, pharmaceutically active metabolite, or

pharmaceutically acceptable salt thereof.

432

8.   A compound, pharmaceutically acceptable prodrug,

pharmaceutically active metabolite, or pharmaceutically acceptable salt according

to claim 7, wherein:

R^1 is a substituted or unsubstituted bicyclic heteroaryl, or a group of the

5   formula CH=CH—R^3 where R^3 is a substituted or unsubstituted aryl or heteroaryl;

Y is O, S, C=CH_2, C=O, NH, or N-(C_1-C_8 alkyl); and

R^8 is a substituted or unsubstituted aryl, heteroaryl, alkyl, or alkenyl.

9.   A compound, pharmaceutically acceptable prodrug,

pharmaceutically active metabolite, or pharmaceutically acceptable salt according

10   to claim 7, wherein:

R^1 is CH=CH—R^3, where R^3 is a substituted or unsubstituted aryl group;

Y is O or S; and

R^8 is a substituted or unsubstituted aryl or heteroaryl.

10.   A compound of the Formula IV:
IV.

15

wherein:

R^1 is a substituted or unsubstituted aryl or heteroaryl, or a group of the

formula CH=CH—R^3 or CH=N—R^3, where R^3 is a substituted or unsubstituted

alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl;

20   Y is O, S, C=CH_2, C=O, S=O, SO_2, CH_2, $CHCH_3$, NH, or N-(C_1-C_8 alkyl);

R^9 is a substituted or unsubstituted alkyl, cycloalkyl, heterocycloalkyl,

aryl, heteroaryl, alkoxyl, aryloxyl, cycloalkoxyl, NH-(C$_1$-C$_8$ alkyl), NH-(aryl),

NH-(heteroaryl), N=CH–(alkyl), NH(C=O)R^{11}, or NH$_2$, where R^{11} is independently

selected from hydrogen, substituted or unsubstituted alkyl, cycloalkyl,

5   heterocycloalkyl, aryl, and heteroaryl; and

R^{10} is independently selected from hydrogen, halogen, and lower-alkyl;

or a pharmaceutically acceptable prodrug, pharmaceutically active

metabolite, or pharmaceutically acceptable salt thereof.

11.   A compound, pharmaceutically acceptable prodrug,

10   pharmaceutically active metabolite, or pharmaceutically acceptable salt according
to claim 10, wherein:

R^1 is a group of the formula CH=CH—R^3 where R^3 is a substituted or

unsubstituted aryl or heteroaryl;

Y is S or NH; and
15   R^9 is a substituted or unsubstituted alkyl, alkoxyl, or NH-(heteroaryl).

12.   A compound, pharmaceutically acceptable prodrug,

pharmaceutically active metabolite, or pharmaceutically acceptable salt, selected

from:

20

13.   A pharmaceutical composition comprising:

(a)   a therapeutically effective amount of a compound,

pharmaceutically acceptable prodrug, pharmaceutically active metabolite, or

pharmaceutically acceptable salt of claim 1; and

5   (b)   a pharmaceutically acceptable carrier, diluent, or vehicle therefor.

14.   A method of treating a mammalian disease condition mediated by

protein kinase activity, comprising administering to a mammal in need thereof a

therapeutically effective amount of a compound, pharmaceutically acceptable

prodrug, pharmaceutically active metabolite, or pharmaceutically acceptable salt

10   as defined in claim 1.

15.   A method according to claim 14, wherein the mammalian disease

condition is associated with tumor growth, cell proliferation, or angiogenesis.

16.   A method of modulating the activity of a protein kinase receptor,

comprising contacting the kinase receptor with an effective amount of a

15   compound, pharmaceutically acceptable prodrug, pharmaceutically active

metabolite, or pharmaceutically acceptable salt as defined in claim 1.

17.   A method according to claim 16, wherein the protein kinase

receptor is a VEGF receptor.
